Praefatio.

Causis a cl. professore equ. de Beek expositis, quae optandam reddiderint iconum florum Europae mediae additamenta, nobis restat explicare, quae momenta in eligendis iconibus nostris secuti simus.

Prope innumerabiles, id quod modo dictum est, sunt novae Hieraciorum formae et specie et valore systematico praestantes, quae a botanicis multis et illustribus his decem lustris per Alpium tractum investigatae sunt. Ob hanc ipsam formarum novarum copiam speramus fore, ut benigna nobis detur ab Hieraciologis Hieraciophilisque venia, quod etiam in hoc nostro opere Plautinum illud „tunica pallio propior“ admodum valeat i. e. quod formas Alpium orientalium mediarumque, quas ipsi locis naturalibus inspeximus, praeferendas censuerimus, idque, ut putamus, eo rectius, quod hae Alpium partes a pluribus botanicis peragrantur quam Gallicae Alpes quamvis ditissimae Hieraciorum. Si pariter aequaliterque respexissemus omnes Europae mediae et australioris partes, vix quinque volumina novis Hieraciis delineandis satis fuerunt.

Imprimis operam dedimus, ut iterum atque saepius illae formarum series, quibus species principales inter se coniunguntur, quam plenissime proferantur, ita ut naturae quasi rationes phylogeneticae, quae in Hieraciorum genere valuerint valeantque, manifeste appareant. Pro certo habemus — multique et peritissimi botanici iam nobiscum consentiunt — nodum Gordium in hoc genere propositum nulla alia ratione dissolvi posse nisi methodo Naegeliano etsi ex parte emendando restringendoque.

Iconum textusque ordo, quem in hoc opere observamus, cum eo ordine congruit, quo Hieracia in Kochii Synopseos editione III. a Hallier et Wohlfarth edita disposita sunt, scilicet ita, ut speciem quamque principalem s. primi ordinis eae formae, quae intermediae sunt aut compositae ex hac specie et praecedentibus, subsequantur.

Selectas formas novas e subgenere *Pilosella* certis de causis praeter ordinem solitum *Euhieraciis* postponere statuimus.

Reliquum est, ut gratis animis memoremus icones ab amico nostro **Josepho Poell** Oenipontano summa cura summaque arte delineatas esse et pictas.

Tridenti	}	Kal. Oct. a. MCMIV.

J. Murr. H. Zahn.

Hieracium (Habichtskraut).

(Tournef., Jnst. 469, tab. 267 pp.; Linné, Gen. I Nr. 620 pp.) Tausch, **Bemerk.** Hierac. in Flora 1828, Ergänzungsblatt I; Froelich in DC., Prodr. VII (1838); Fries, Symbolae 1848), Epicrasis (1862); Grisebach, Commentatio de distrib. Hieracii gen. (1852); Sendtner, Die südbayrischen Hieracien, in Flora (1854); Naegeli-Peter, Die Hieracien Mitteleuropas I (1885), II (1886—1889); Arvet-Touvet, Les Hieracium des Alpes françaises (1888); K. H. Zahn, in Koch Synopsis (ed. Hallier-Wohlfahrt) p. 1697—1931 (1901) et in Reichenb. Fl. Germ. XIX, II.

Subgenus I. **Euhieracium** Torr. et Gray, Gremli Exkursionsfl. d. Schweiz, Zahn l. c.; *Aurella* Tausch l. c.; *Pulmonarea* Griseb. l. c.; *Archieracium* Fries Epicr. p. 6.

A. **Phyllopoda** (Godet, Čelakovsky) Zahn l. c. p. 1762. — Innovatio per rosulas.

Sectio I. **Glaucia** Fries, Epicr. p. 66; Zahn l. c. p. 1762; Glaucina N. P. II p. 1. — Folia pilis simplicibus ± denticulatis obtecta, eglandulosa, ± glauca, rigida, basin versus ± angustata, glabra, rarius in margine et subtus in nervo mediano subpilosa. Involucri squamae numerosae in plures series contiguas dispositae, angustae (exteriorae intimis obtusis breviores), adpressae, ± canofloccosae, rarius subpilosae v. subglandulosae. Receptaculi alveoli dentati (non ciliati); ligulae non ciliatae. Radix apice nuda, non lanato-comosa.

I. **Hieracium bupleuroides** Gmel., Flor. Bad. III p. 317, tab. 2 (Grex Crinifolium N. P. II p. 17 et 25), subspecies **Gamperdonense** Murr et Zahn (1903). — Caulis 15—30 cm altus, suberectus, subtenuis, subtiliter striatus, furcato-ramosus; accladium $\frac{1}{3}$ — $\frac{1}{2}$ caulis exhibens. Inflorescentia 2—3 (—6) cephalae; ordines axium 2 (rarissime 3); rami primarii 1—2 (—3), oblique-erecti. Folia rosularia complura, subpetiolata, denticulata, exteriora breviora lanceolata acutiuscula, in margine et subtus parce pilosa, interiora longiora angustiora acuta, subepilosa; caulina 2—4, lineari-lanceolata glabra. Involucrum 10—13 mm longum, ovatum, demum basi subtruncatum; squamae sublatiusculae (exteriorae angustiores) subattenuatae subobtusae, obscurae vel nigricantes, vix marginatae (interiores submarginatae); pedunculi involucrum versus incrassati; bractae 5—8, subulatae. Pili involucri subnumerosi, 1 mm longi, obscuri apice diluti, in pedunculis superne sparsi, inferne et in caulibus nulli. Glandulae involucri sparsae v. subnullae, caulomata eglandulosa. Flocci in squamarum marginibus subnumerosi, pedunculi superne tomentosi, inferne pariter ac caules et folia effloccosi. Flores saturate lutei, ligulae glabrae; styli obscuri; achaenia castanea, 3,5 mm longa.

Crescit in declivibus calcareis Vorarlbergiae prope alpem St. Rochus in valle „Gamperdonatal“ iuxta montem „Scesaplana“, ubi detex. a. 1903 Dr. Murr. — Floret Aug.

Tab. 1, Fig. 1—5. *H. Gamperdonense* M. et Z. 1. Planta spont. 2. Fol. rosulae. 3. Pedunculus sub involucro. 4. Squama. 5. Achaenium.

Sectio II. **Villosa** Naeg.-Pet. II p. 85, Zahn l. c. p. 1766. — Folia pilis simplicibus \pm dentatis oblecta, eglandulosa, glauca. pilis elongatis mollibus vestita vel subglabra, caulina basi vulgo non contracta. Capitula ampla, longe pedunculata; involucri squamae latae, laxae v. squarrosae, effloccosae, dense villosae, exteriores acutae, interiores late lineares acutissimae, apice sub lente minutissime glandulosae. Ligulae interdum subciliatae.

2. Hieracium villosum L., Spec. plant. ed. 2 p. 1130, subspecies **calvifolium** N. P. II p. 103; *H. villosum* λ . **glabrum** Froel. in DC. Prodr. VII (1838) p. 228; *H. villosum semiglabratum* Fries Symb. (1848) p. 52; *H. villosum* β **nudum** Grenier et Godron, Fl. France II (1850) p. 357, non A. Kerner. — Caulis 20–30 (–35) cm altus, crassiusculus, substriatus, subflexuosus, vulgo monocephalus. Folia rosularia subnumerosa v. pauca, \pm lanceolata, basi attenuata, saepe subpetiolata, inferiora subobtusa, intima \pm acuta, subundulata, hinc inde irregulariter subdentata, glauca, submollia; caulina 4–6, lanceolata, saepe subaequilata, superiora basin versus angustata v. rotundata sessilia, omnia breviter acuta, sensim in bracteas decrescentia, saepe flavescentia. Inflorescentia furcata, indeterminata, 1 (–3) cephalia, ramis caulem aequantibus; acladium 3–11 cm longum; ordines axium 1 (–2), rami primarii 0 (–2), valde remoti, crassiusculi. Involucrum 13–15 (–17) mm longum, late globosum; squamae exteriores subfoliaceae, lanceolatae, virides, interiores \pm lineares obscuriores, omnes acutissimae. Bracteae 6–8, subfoliaceae, sensim in squamas decrescentes. Pili basi obscuri, in involucrio copiosissimi albi molles, usque ad 3 mm longi, in pedunculis caulibusque superne copiosi, ad 6 mm longi, inferne usque ad basin sensim deminuti, in foliis supra nulli v. (etiam subtus) marginem versus rari, in margine ipso subcopiosi, 3–4 mm longi, in parte superiore foliorum caulinarum semper frequentiores. Glandulae nullae, versus apicem squamarum interiorum sparsae, minutissimae. Flocci: caulomata superne canotomentosa, inferne usque ad basin multiflocca, involucrum effloccosum. Flores dilute flavi, extus vix pilosi, ligulae vulgo epilosae; styli concolores v. subobscuri; achaenia nigro-brunea, 3,5 mm longa.

Crescit non infrequens in alpibus calcareis Delphinatus, Sabaudiae, Helvetiae, Algoviae, Tiroliae, Salisburgiae, Carinthiae, inter 1100–2700 m. — Floret Jul. Aug.

Exsiccatae: Hieracia Naegelianae exsiccata Nr. 348.

Tab. 2, Fig. A. 1–6. *H. villosum* L. ssp. *calvifolium* N. P. 1. Planta spont. 2. Pedunculus involucri. 3, 4. Squamae. 5. Flos. 6. Achaenium.

Species intermedia:

3. Hieracium glabratum Hoppe, in Willd. Spec. plant. III, 3 (1800) p. 49 pp.; *H. villosum* β . **glabratum** Neilr. Nachtr. Flor. v. Wien (1851) p. 178; *H. scorzonrifolium* Reichenb., Icones XIX (1860) p. 114, tab. 202, fig. II, et *H. glabratum* l. c. p. 114, tab. 203, fig. II. Subspecies **glabratiforme** Murr, in Deutsche bot. Monatsschrift (1897) p. 226; *H. nudum* A. Kerner in sched. apud Naeg.-Pet. l. c. II p. 144, non Gren. et Godr. Fl. France II p. 357; *H. villosum* L. var. **glabrescens** F. Schultz, Archives (1850) p. 178; Murr in Dörfler, Herb. norm. cent. XXXII Nr. 3134. — *Forma intermedia inter H. villosum* L. et *H. glabratum* Hoppe. — Caulis 6–25 cm altus, tenuis, subflexuosus, subtiliter striatus, basin versus saepe rubro-coloratus, vulgo monocephalus. Folia rosularia pauca v. complura (saepe longe-) petiolata, exteriora \pm spatulata rotundata, pleraque lanceolata et anguste-lanceolata v. sublinearia, \pm acuminata, integra v. remote et obscure-denticulata v. dentata; caulina 3–4, \pm sensim

decrecentia, inferiora \pm petiolata v. sessilia, basin versus attenuata, superiora saepe basi rotundata, omnia glauca, rigidiuscula. Inflorescentia rarissime 2 cephala; acladium 4—6 cm longum. Involucrum 11—14 cm longum, \pm globosum; squamae sublatiusculae v. angustae, acutissimae, obscurae, exteriores sublaevae. Bractae paucae, minutae. Pili involucri copiosissimi, diluti, 2—3 mm longi, in caulibus superne numerosi, 1,5—2,5 mm longi, inferne usque ad $\frac{1}{3}$ totius caulis sensim deminuti et breviores, basin versus nulli, in marginibus foliorum superiorum satis copiosi, in foliis inferioribus nulli v. in marginibus basin versus solitarii. Glandulae nullae, apicem squamarum versus parum evolutae, minutissimae. Flocci: involucrum subeffloccosum, caulis superne cano- v. albo-tomentosus, inferne usque ad $\frac{1}{3}$ totius caulis (saepe ad basin) sensim deminute-floccosus, folia effloccosa. Flores dilute-flavi, ligulae epilosae; styli diluti; achaenia atra, 3 mm longa.

Crescit in alpidis calcareis et dolomiticis Tiroliae, Algoviae, Carinthiae, Salisburgiae, Norici, Austriae sup., Transsilvaniae, Bosniae, inter 1300—2600 m. — Floret m. Jul. Aug.

Subspecies bene distincta, ab *H. villosa* ssp. *calvifolium* N. P., cum quo confunditur et jungitur, plane diversa.

Exsiccatae: *Hieracia Naegelianae* exsicc. Nr. 356, 357 (var.); Billot, Fl. Gall. et Germ. exsicc. Nr. 1095 bis pp.; Dörfler, Herb. norm. cent. XXXII Nr. 3134 (sub nomine *H. glabrescens* F. Schultz); Flora exsicc. Austro-Hungarica cent. XXXIV (1901) Nr. 3327 (e monte Blaser p. Trins, leg. A. Kerner!).

Tab. 2, Fig. B. 1—4. *H. glabratum* Hoppe ssp. *glabratiforme* Murr. 1. Plante spontanea (e monte Salzberg p. Innsbruck, leg. Dr. Murr). 2. Squama. 3. Flos. 4. Achaenium.

4. *Hieracium villosiceps* Naeg.-Pet., Hierac. Mitteleurop. II p. 105, subspecies **comatulum** N. P. l. c. p. 113. — Habitus *H. bupleuroidis*, indumentum *H. villosi*. — Caulis ad 30 cm altus, gracilis v. tenuis, subtiliter striatus, saepe usque ad medium ramosus. Folia rosularia numerosa, basin versus attenuata subpetiolata, lineari-lanceolata, acuta, subdenticulata v. subintegra; caulina 4—6, cito decrecentia, attenuata sessilia, omnia subglaucescentia-luteo-viridia, rigidiuscula. Inflorescentia alte furcata, indeterminata, \pm suprafastigiata, (1—) 2—4 cephala; acladium 3—4 cm longum; ordines axium 2, rami primarii (0—) 1—3, remoti, graciles, elongati, rigidiusculi. Involucrum 11—13 mm longum, globosum; squamae lineares, acuminatae, acutissimae, obscurae, indumento densissimo obiectae. Bractae 3—4, lineares v. subulatae. Tota planta pilis copiosissimis sericeis albis vestita, pili in involucrio et foliis ad 3 mm, in pedunculis et caulibus ad 7 mm longi. Glandulae nullae, apicem squamarum versus subnumerosae, minutae. Flocci in involucrio foliisque nulli, caulomata superne cano-tomentosa, deinde deminute-floccosa, infra medium effloccosa. Flores subdilute flavi, extus cum dentibus ligularum subepilosi; styli subobscuri; achaenia brunea, 2,7 mm longa, saepe infertilia.

Crescit in alpidis calc. et dolomiticis Tiroliae: Haller Salzberg, Kaserenwiesen p. Neuprags, Monte Piano p. Schluderbach; Salisburgiae: Untersberg; Bavariae: Mittewald ad fl. Isar. — Floret Jul. Aug.

Exstat var. **lonchiphylum** N. P. l. c. p. 114: folia lanceolata v. anguste-lanceolata, distincte petiolata, in Helvetia: Eginental, Ormonts, Engadin, Hinterrhein; Bavaria: Schliersee; Tirolia: Neuprags; Jura: Dôle (v. N. P. l. c. p. 114, 115).

Exsiccatae: *Hieracia Naegelianae* Nr. 350 (var. *lonchiphylum*).

Tab. 3, Fig. A. 1—5. *H. villosiceps* N. P. ssp. *comatulum* N. P. var. *genuinum* N. P. 1. Planta spont. ex alpi. Tirol.: Haller Salzberg (leg. Dr. Murr). 2, 3. Squamae. 4. Flos. 5. Achaenium.

5. Hieracium villosiceps N. P. l. c. p. 105, subspecies **sericotrichum** N. P. l. c. p. 116 — Caulis ad 24 cm altus, subgracilis, subtiliter striatus, vulgo monocephalus. Folia rosularia 2—6, vulgo distincte petiolata, lanceolata, acuta (exteriora saepe subspathulata subobtusata), integerrima v. remote denticulata, plana; caulina 3—6, lanceolata, basin versus angustataa cuto cito decrescentia; omnia subglauescentia, rigidiuscula. Inflorescentia interdum furcata 2-cephala; aeladium ad 9 cm longum. Involucrum 12—13 mm longum, globosum; squamae exteriores ± lanceolatae, laxae, interiores sublineares, omnes acutissimae obscurae. Bractee 2—3, subfoliaceae. Tota planta pilis sericeis albis numerosissimis, 3—4 mm longis, in caulibus ad 7 mm l. obiecta. Glandulae nullae versus apicem squamarum interiorum satis numerosae, minutissimae. Flocci in involucri et foliis nulli, caulomata superne canotomentosa, inferne usque ad medium caulem sensim deminute-floccosa. Flores dilute flavi, extus cum ligulis modice pilosi; styli obscuri; achaenia matura atra, 3,8 mm longa.

Variat: α) **genuinum** N. P. l. c. p. 116; *H. perpilosum* Arv.-Touv. ap. Briquet, Herb. Tyr. mérid. in Bull. Laborat. Bot. gén. Genève I, p. 288 (Bull. Herb. Boiss. 1897 p. 477).

Crescit in alpi. Tiroliae: Mühlwaldtal, Vennertal, Schlernklamm, Enneberg, Kerschbaumer Alpe; Carinthiae: Auernig p. Pontafel, Osternig p. Tarvis; Vorarlbergiae: Scesaplana; Bavariae: Watzmann, Königsee (cf. N. P.); Helvetiae: Zwischbergen, Grammont etc. — Floret m. Jul. Aug.

β) **decrescens** N. P. p. 117. Caulis ad 15 cm altus, monocephalus, ± tenuis; folia rosularia numerosa, exteriora ± spathulato-lanceolata, subobtusata, interiora lanceolata acuta; fol. caulina 2—4, cito decrescentia.

Crescit in alp. calc. et dolomit. Tiroliae: Neuprags, Schludersbach, Treeroci, Monte Spinale, Seiser Alpe, Kals, St. Anton; Carinthiae: Pasterze, Tarvis, Raibl, Plöcken; Carnioliae: Savrenza p. Wurzen; Helvetiae: Engadin, Splügen. — Floret m. Jul. Aug.

H. eriophyllum Willd. ssp. *eriophyllum* forma 3) *protractum* N. P. II p. 301, e loco „Schwarzau“ in Austria inf., est forma magis evoluta *H. sericotrichi* (vidi in herbario cl. d. E. Khék Vindobon.).

Tab. 3, Fig. B. 1—5. *H. villosiceps* N. P. ssp. *sericotrichum* N. P. var. β. *decrescens* N. P. 1. Planta spont. ex Tirolia: Plaetzwiesen p. Schludersbach. 2, 3. Squamae. 4. Flos. 5. Achaenium.

Species intermediae:

6. Hieracium praetensum Arvet-Touv. et Briquet, Nouv. Notes florist. Alp. Léman. p. 87 (1899); *H. valdelitigiosum* Murr, Deutsch. bot. Monatsschrift (1902) p. 75, Österr. bot. Zeitschr. (1902) p. 319. — *Ex affinitate H. dentati* Hoppe. Caulis ad 40 cm altus, gracilis v. crassiusculus, erectus, subflexuosus v. flexuosus, substriatus. Folia rosularia nonnulla v. complura, basin versus attenuata, distincte petiolata, oblongo-spathulata, oblongo-lanceolata v. lanceolata, denticulata, raro subdentata, exteriora obtusa, interiora longiora, (saepe subplicato-) acuminata; caulina 4—6, sensim decrescentia, inferius subpetiolatum, superiora late lanceolata, basin versus saepe subpanduriformia v. breviter attenuata sessilia, hinc inde basi ovata, subdenticulata v. subintegerrima, breviter acuta mucronata, omnia subglauescentia-

luteo-viridia, mollia. Inflorescentia plerumque monocephala; involucrium 13—15 mm longum, ovatum, demum globosum depressum; squamae subangustae, acuminatae, acutissimae, obscure virides. Bracteae 2—3, lineari-lanceolatae. Pili involucri numerosi diluti subsericei, 2—3 mm longi, in tota planta subnumerosi, 2—4 mm longi. Glandulae nullae, versus apicem squamarum tantum dispersae, minutae. Flocci involucri nulli, caulomata superne subcanotomentosa, inferne usque ad medium caulem deminute-floccosa. Flores dilute flavi, ligulae subciliatae; stylus luteus; achaenia castanea, 4,5 mm longa.

Habitus foliorum caulinorum saepe *H. elongatum* Willd. revocans et quasi intermedius inter *H. dentatum* Hoppe et *H. elongatum* Willd. (*dentatum* > *elongatum*), sed sine dubio planta nostra ad subspecies polymorphi *H. dentati* (Gr. Subvillosum) pertinet.

Crescit in alpinis calcareis Tiroliae: Haller Salzberg (leg. Dr. Murr); Helvetiae, Sertigtal p. Davos (leg. Zahn) et in alpinis Valesiae austro-occidentalis et Sabaudiae (Briquet). — Floret m. Jul. Aug.

Tab. 4, Fig. A. 1—3. 1. *H. praetensum* A.-T. et Briq. (e monte Haller Salzberg). 2. Squama interior. 3. Achaenium.

7. Hieracium Trefferianum N. P., Hierac. Mitteleurop. II p. 112; *H. villosiceps* N. P. ssp. *Trefferianum* N. P. l. c.; *H. villosoides* Murr, Deutsche bot. Monatsschr. (1897) p. 242. — Inter *H. glabratum* Hoppe et *H. villosum* L. ssp. *calvifolium* N. P. vel inter priorem et *H. dentatum* Hoppe quasi intermedium. — Caulis ad 25—30 cm altus, crassiusculus, subflexuosus, substriatus, alte furcatus. Folia rosularia 3—5, subpetiolata, oblongo-lanceolata, obtusa v. \pm acuta-mucronata, subintegerrima aut irregulariter remote-subdentata; caulina 4—6, sensim decrescentia, inferiora oblonga, basin versus parum attenuata v. aequilata, superiora ovata sessilia vel cordato-ovata subamplexicaulia; omnia praesertim supra, \pm saturate viridia. Inflorescentia indeterminata, (1—) 2—3 cephalae; acladium 3—5 cm longum; rami primarii 1—2, remoti, crassiusculi, caulem non superantes. Involucrium 16—18 mm longum, late-globosum; squamae lanceolatae-lineares, longe acuminatae, acutissimae, subobscurae. Bracteae 2—3, subfoliaceae. Pili ubique molles, in involucrio copiosi diluti, ad 3 mm longi, in caule subfrequentes, folia mediocriter pilosa (2—3 mm), supra saepe glabrescentes. Glandulae nullae, versus apicem squamarum rariae, minutae. Flocci involucri sparsi, in foliis nulli, caulomata superne albotomentosa, basin versus sensim deminute-floccosa. Flores saturate flavi, extus subepilosi, ligulae saepe cum pilis solitariis; stylus obscurus; achaenia bruneo-atra.

Crescit in alpinis calc. Tiroliae: in monte Wolferkofel in Schwarzenbach p. Luttach (1800 m), in monte Schlern inter Mahlknechtthütte et Rosszähne, in pratis alp. „Plätzwiesen“ pr. Schluderbach (copiose!), in jugo Fedajapass, in monte Höttingeralpe p. Innsbruck.

Formas magis pilosas cl. C. v. Naegeli invenit in Helvetia: Montagne de Fully, 2000—2200 m, et in Algovia: Rotwand p. Schliersee. — Floret Jul. Aug.

Exsiccatae: Dörfler, Herb. norm. cent. XXXII Nr. 3136 (sub nomine *H. villosioides* Murr).

Tab. 4, Fig. B. *H. Trefferianum* N. P. (e monte Höttinger Alpe, leg. Dr. Murr).

8. Hieracium sparsiramus Naeg.-Pet., Hierac. Mitteleurop. II p. 70, subspecies **Halense** Murr in Österr. bot. Zeitschr. (1895) p. 429 et in Koch Synopsis (ed Hall.-Wohlfahrt) p. 1771. — *Planta intermedia, probabiliter hybrida, inter H. glabratum* Hoppe et *H. bupleuroides* Gmelin. — Caulis 20—30 cm altus, subtenuis, subtiliter striatus, 1—2 cephalus.

Folia rosularia 4—6, anguste-lanceolata, acuta, basin versus sensim attenuata (exteriora minora emarcida); caulina 4—6, anguste lanceolata, sensim decrescentia, omnia flavo-vel olivaceo-viridia, glaucescentia, integerrima aut remote denticulata. pilosa, effloccosa, subcrassa. Inflorescentia 1- vel furcato- 2 cephalis; acladium 5—7 cm longum. Involucrum 13—14 cm longum, subglobosum; squamae sublatiusculae, sublaxiusculae, longe acuminatae, acutae, in bracteas decrescentes, obscurae, exteriores obscure virides. Bracteae 3—4, lineari-lanceolatae, ciliatae. Pili involucri modice numerosi, 2—3 mm longi, apice diluti, in pedunculis dispersi, in caulibus nulli. Glandulae nullae. Flocci in pedunculis superne copiosi, inferne mox rarescentes et nulli, raro per tertiam partem caulis descendentes. Flores dilute-flavi, ligulae glabrae; stylus obscurus; achaenia castanea, 3,5 mm longa.

Crescit in alpinis Tiroliae: Halltal p. Innsbruck (ubi detex. loco exiguo Dr. Murr). — Floret m. Julio.

Exstat forma *tubulosa* in jugo Flexensattel p. Stuben versus Zürcher Alpe, Vorarlbergiae (Murr).

Tab. 5, Fig. A. 1—4. *H. sparsiramum* N. P. ssp. *Halense* Murr. 1. Planta spont. vallis „Halltal.“ 2, 3. Squamae. 4. Achaenium.

9. Hieracium sparsiramum N. P. l. c. p. 70, subspecies **Mediosilvanum** Murr et Zahn in Koch Synopsis (ed. Hall-Wohlfahrt) p. 1771. — *Planta hybrida inter H. villosum* L. ssp. *calvifolium* N. P. et *H. bupleuroides* Gmel. Habitus prioris. — Caulis 30 cm altus, subflexuosus, gracilis, subtiliter striatus, epilosus, furcato-ramosus. Folia rosularia in nostra planta emarcida; caulina 4—6, sensim decrescentia, lanceolata, superiora ovato-lanceolata, omnia basin versus ± attenuata sessilia, acuta, subundulata, remote-subdentata, glauca, rigidiuscula. Inflorescentia in planta nostra 2-cephala; acladium ad 17 cm longum. Involucrum 15—17 cm l., ovatum; squamae obscurae latiusculae acuminatae subacutae, exteriores latiores subfoliaceae, in bracteas sensim decrescentes. Bracteae 2—3, subfoliaceae. Pili involucri haud numerosi, 2—3 mm longi, apice diluti, caulomata et folia pilosa. Glandulae nullae. Flocci involucri sparsi, pedunculi superne leviter tomentosi, inferne mox diminuti, in caulibus nulli. Flores dilute flavi, ligulae pilosae; stylus obscurus; achaenia obscura, 3,5 mm longa, an fertilia?

Crescit in alpinis Bavariae: Dammkar p. Mittewald (detex. Dr. Murr). — Floret m. Julio.

Tab. 5, B. Fig. 1—4. *H. sparsiramum* N. P. ssp. *Mediosilvanum* M. et Z. 1. Planta spont. 2. 3. Squamae. 4. Achaenium.

10. Hieracium cenisium Arvet-Touv., Les Hieracium des Alpes franç. (1888) p. 32; Murr in Deut. bot. Monatschr. (1890) p. 109, Österr. bot. Zeitschr. (1893) p. 222, Allgem. bot. Zeitschr. (1895) p. 191; *H. dentatum* Hoppe ssp. *cenisium* Zahn in Koch Synopsis (ed. Hall-Wohlfahrt) p. 1796. — *Species intermedia inter H. villosum* L. ssp. *calvifolium* N. P. et *H. bifidum* (sensu lato) W. Kit., v. *inter H. glabratum* Hoppe et *H. incium* Hoppe. — Caulis 10—40 cm altus, subgracilis, subtiliter striatus, erectus, saepe monocephalus, raro 2—3 (—5) cephalus, basin versus saepe violascens. Folia rosularia obovata-lanceolata v. oblonga, in petiolum ± longe attenuata, subobtusumucronulata v. breviter acuta; caulina 2—5, inferiora basin versus attenuata-cuneiformia, superiora aequilata-sessilia vel basi rotundata, saepe subattenuata, acuminata acuta; omnia subintegerrima aut subdentata, rigidiuscula, glauca v. subpruinosa, saepe violaceo-maculata, glabra, in margine et subtus pilis mollibus brevibus subpilosa. Inflorescentia alte furcata, acladium 3—5 cm longum; rami primarii

1 (—4) monocephali, remoti, erecti v. oblique-erecti; involucri c 10–12 mm longum, ovatum; squamae angustae, acuminatae, acutissimae, adpressae, obscurae. Bractee 1–2, parvae. Pili involucri satis numerosi, caulomata superne minus pilosa, inferne glabra v. pilis solitariis obsita. Glandulae nullae, versus apicem squamarum rarissimae, minutissimae. Flocci involucri plerumque numerosi, pedunculi canotomentosi, caules inferne deminute-floccosi, basin versus effloccosi. Flores dilute flavi, ligulae glabrae v. subglabrae; stylus obscurus v. subluteus; achaenia matura subatra.

Crescit in alpinis calcar. Delphinatus, Sabaudiae, Tiroliae: Höttinger Alpe, Brenner, Ahrntal, Mte. Bondone, Mte. Baldo, Ampezzo.

Exsiccatae: Dörfler, Herbarium normale cent. XXXII Nr. 3140.

Tab. 6. 1—7. *H. cenisium* A.-T. (e monte Höttinger Alpe, leg. Murr). 1. Planta monocephala. 2. Folia rosularia. 3. Pedunculus sub involucrio. 4, 5. Squamae. 6. Flos. 7. Achaenium.

II. Hieracium glabratoides Murr, Österr. bot. Zeitschr. (1893) p. 221, (1895) p. 428; Zahn in Koch Synopsis (ed. Hall.-Wohl.) p. 1805. — *Species inter H. glabratum* Hoppe et *H. subspeciosum* N. P. ssp. *subspeciosum* Naeg. (Hierac. Mitteleurop. II p. 156) *intermedia*, *origine probabiliter hybrida*. — Caulis 20–50 cm altus, crassiusculus, substriatus, subflexuosus, furcatus. Folia rosularia 6–9, lanceolata, in petiolum brevem sensim angustata, subacuminata, acuta, denticulata v. subdentata; caulina 4–7, cito decrescentia, anguste lanceolata, basin versus subattenuata, acuta; omnia glaucescentia, submollia, glabra v. rarius in margine basin versus pilis paucis brevibus obsita. Inflorescentia 1–3 (—5) cephalae; acladium 4–7 cm longum; rami primarii 1–2 (—4), remoti, oblique erecti. Involucri grande, 13–15 mm longum, ovato-globosum; squamae sublatiusculae, longe acuminatae, acutae, subobscurae. Bractee 3–5, lineari-lanceolatae v. subulatae. Pili involucri numerosi brevi, in pedunculis superne dispersi, inferne et in caulibus nulli. Glandulae nullae. Flocci involucri parum evoluti, pedunculi tomentosi, caulis usque ad medium deminute-floccosus. Flores dilute flavi, ligulae glabrae; stylus subobscurus; achaenia obscure brunea.

Crescit in alpinis calc. Tiroliae: Haller Salzberg p. Innsbruck, 1700 m, in consorcio *H. subspeciosum* N. P. et *H. glabrati* Hoppe, a quibus originem trahit (Dr. Murr). — Floret m. Jul. Aug.

Exsiccatae: Dörfler, Herb. norm. cent. XXXII Nr. 3135.

Tab. 7. 1–4. *H. glabratoides* Murr. 1. Planta orig. 2. Squamae. 3. Flos. 4. Achaenium.

12. Hieracium excellens Murr in sched. (1900) et in Koch Synopsis (ed. Hall.-Wohl.) p. 1805. — *Species hybrida inter H. subspeciosum* N. P. ssp. *subspeciosum* Naeg. l. c. et *H. bupleuroides* Gmel. Habitus *H. bupleuroidis*. — Caulis 40–60 cm altus, strictus, striatus, crassiusculus, alte furcatus. Folia rosularia complura, saepe emarcida, lanceolata, basin versus sensim angustata-subpetiolata et sparsim pilosa; caulina 8–12, sensim decrescentia, lanceolata basin versus subattenuata, superiora basi subrotundata sessilia; omnia glauca, acuminata, acuta, remote denticulata (superiora integra), glabra, effloccosa. Inflorescentia 2–4 cephalae; acladium 3–5 cm longum; rami primarii 1–3, subremoti, oblique-erecti, graciles. Involucri c. 14 mm longum, ovato-globosum; squamae sublatiusculae, acuminatae, obtusiusculae, subobscurae. Bractee 3–4, subulatae. Pili involucri sparsi vel subnumerosi, breves, basi obscuri, caulomata epilosa. Glandulae involucri subnullae, caulomata eglandulosa. Flocci

involucris satis numerosi, in pedunculis copiosi, inferne deminuti, in caulibus subnulli. Flores dilute flavi, ligulae glabrae; stylus obscurus; achaenia castanea-atra.

Crescit in Tirolia sub radicibus montis Solstein p. Innsbruck, ubi detexit exemplaria peropima Dr. Murr, specimina minora (rarissime) in monte Salzberg p. Hall. — Floret m. Julio.

Variat: β) **crininervum** Murr et Zahn in Koch Synopsis l. c. Folia subtus in nervo mediano pilis mollibus longis sparse pilosa. —

Tirolia: In monte Solstein p. Innsbruck.

Tab. 8. 1—7. *H. excellens* Murr. 1. Planta genuina (e monte Salzberg!). 2. Folium rosulae. 3. 4. Squamae. 5. Pedunculus involucris. 6. Flos. 7. Achaenium.

Sectio III. **Barbata** Gremli, Neue Beitrage zur Flora d. Schweiz III (1883) p. 47; Burnat et Gremli, Hieracium Alp. marit. (1883) p. 15; Zahn in Koch Synops. (ed. Hall.-Wohlf.) p. 1771 (1901); *Glandulifera* N. P., Hierac. Mitteleuropas II p. 241 (1889); *Villosa* Fries, Epicrisis p. 6 et p. 61 pp. (1862). — Folia pilis simplicibus \pm denticulatis oblecta, eglandulosa, \pm glauca, subtenuia v. subrigida, dense et longe pilosa, saepe subpilosa, interdum glabra; caulina nulla v. 1 (—2) evoluta parva. Caulis humilis simplex, rarissime furcato-ramosus 2—3 (in planta culta ad 5—) cephalus. Capitula subampla \pm globosa; involucris squamae angustae, vulgo longe acuminatae acutissimae, adpressae, effloccosae, pilis tenuibus numerosissimis longis sordide albidis v. fuliginosis v. subobscuris dense barbato-villosae. Glandulae ubique nullae, apicem squamarum versus subnullae, minutissimae¹⁾, interdum in caulem \pm evolutae v. caulis omnino glandulis numerosissimis oblectus. Ligulae apice non ciliatae. Achaenia minora quam in aliis Hieraciis (2,5—2,8 mm l.). — Crescunt in alpibus elatioribus.

13. Hieracium glanduliferum Hoppe apud Sturm, Heft 39 (1815); N. P., Hierac. Mitteleurop. II p. 243 (sensu lato), Zahn l. c. p. 1771.

Dispositio gregum.

I. Subnivale. Squamae involucris \pm obtusiusculae, non longe acuminatae acutissimae; folia subprasino-viridia.

II. Piliferum. Squamae involucris longe acuminatae acutissimae. Caulis eglandulosus, pilosus.

III. Amphigenum. Squamae ut in II; caulis \pm glandulosus et \pm pilosus.

IV. Glanduliferum. Squamae ut in II; caulis glandulosissimus, epilosus.

I. Grex Subnivale.

Subspecies **subnivale** (N. P. II p. 250, Zahn l. c.) Gren. et Godron, Fl. France II p. 356 (1850), Fries, Epicr. p. 26 (false in Subgenus Pilosella inserendum); Grieseb., Comm. p. 66. — Caulis 10—15 (—20) cm altus, tenuis v. gracilis, rigidus, semper simplex monocephalus, rarissime furcato-2cephalus. Folia rosularia numerosa, exteriora \pm spathulata (saepe mucronate) obtusa, interiora \pm lanceolata, acutiuscula v. acuta, non petiolata, basin versus angustata, integerrima, glaucescentia v. subpruinosa saepe subrubro- v. violaceo-colorata, rigidiuscula; caulina nulla v. bracteiformia. Involucrum 9—14 mm longum globosum; squamae sublatiusculae v. angustae, obtusiusculae, subnigrae, immarginatae, laxiusculae. Pili involucris numerosissimi albi sericei, 5—6 mm longi, in caule \pm numerosi, 6—8 mm longi, in foliis supra usque ad basin numerosi sericei flexuosi, 4—6 (—8) mm longi, subtus subnulli, folia

¹⁾ Apud Naeg. Pet. II p. 241 et 243 squamae sunt „eglandulosae“, sed specimina copiosa mihi obvia sub lentem fere semper apicem squamarum versus glandulifera erant.

interdum subglabrata, solum in margine ciliata. Glandulae¹⁾ in involucri nullae, in caule superne sparsae v. subnumerosae, inferne dispersae v. nullae. Flocci in involucri et in foliis nulli, caulis superne albido-tomentosus, inferne usque ad basin deminute-floccosus. Flores dilute flavi, evoluti v. saepe abbreviati subtubulosi; stylus luteus v. \pm obscurus; achaenia 2,5 mm longa, griseo-brunea v. obscure brunea.

Crescit inter 1800—2400 m in alpinis Delphinatus: Col Isouard! Col de Paga, versant de la vallée de Serrières (loc. class.), Aiguille Rouge pr. Briançon! Mte Viso: Brèche de Ruines, Col Lacroix, Col Longet; Sabaudiae: Mont Cénis, Saut des Allues, Col Iseran, le Vallonot pr. Bonneval, le Galibier! le Mauvais-Pas pr. la Mer de Glace in valle Chamonix (sec. Arv.-T.); in Alpibus Maritimis Galliae: Col de Pourriac pr. Salzo-Morena; Italiae: Cima di Pian Bernardo, in monte Garessio, in alpe Rascaira, in valle Bellino et in alpinis vallis Maira; in alpinis Pedemontii: pr. Limone! — Floret m. Jul. Aug.

Exsiccata: Société dauphinoise no. 1289 (1880) et 1289 bis!

Tab. 9, Fig. C. 5, 6. *H. glanduliferum* Hoppe ssp. *subnivale* Godr. Gren. (e monte Aiguille Rouge pr. Briançon, Hautes-Alpes, leg. Brachet). C. Planta. 5. Squama. 6. Pedunculus sub involucri.

III. Grex Amphigenum.

Subspecies **amphigenum** Arv.-Touv. in J. Briquet, Notes floristiques Alpes Léman. p. 21. (Annuaire du Conserv. et du Jardin botan. de Genève, 1889). — Habitus *H. piliferum* Hoppe, caulis pilis longis \pm dense vestitus, immixtis brevioribus glanduliferis sparsis vel parum numerosis. — Floret m. Jul. Aug.

Variat: α) **multiglandulum** N. P. II p. 248. Capitula 12—15 (—16) mm longa, globosa.

1. normale. Pili involucri numerosissimi fuliginosi v. subobscuri, folia utrimque \pm longe pilosa. — In alpinis Delphinatus, Helvetiae, Sabaudiae, Tiroliae et Carinthiae non infrequens.
2. subschraderi. Pili involucri numerosissimi subalbidi, folia utrimque \pm longe pilosa. — Cum praecedente, sed minus copiose.
3. tubulosum. Pili in involucri et in foliis ut in 1, involucri \pm depressum, flores tubulosi, stylus obscurus longe exsertus, planta saepe furcata. — In alpinis Helvetiae: in monte Grd. St.-Bernard, Simplon, Valserberg, Bernina, Tiroliae: in jugo Brenner, in alpinis vallis Virgental etc.

Exsiccata: Flora Austro-Hungarica no. 3332 II (sub nom. *H. piliferum*, e monte Blaser pr. Matrei, Tiroliae).

- β) **gracilisquamum** N. P. II p. 250; *H. piliferum* auct. quoad plantam pyrenaicam (Fries, Hierac. europ. exsicc. 34^b, Bordère exsicc!). Caulis humilis (6—12 cm), involucri 10—11 mm longum, squamae angustissimae acutissimae. — In Pyrenaeis: in cacumine m. Pic Blanc! — Specimina copiosa mihi obvia semper in caule superne glandulifera erant, quod ex descriptione Naegeli-Peteriano non patet. — Sec. N. P. I. c. etiam in Delphinatu: Le Galibier pr. La Grave, et in Helvetia: in valle Binntal.

¹⁾ „Glandulae ubique nullae“ ex Fries Epicr. p. 26 et N. P. II p. 250, sed in caule superne semper evolutae, ut jam docent Godr. Gren. l. c., Grieseb. l. c., Burnat et Gremli c. l. p. 15.

Tab. 9, Fig. B. 3. 4. *H. amphigenum* A.-T. α) *multiglandulum* N. P. 1) *normale*. B. Planta (e jugo Schlüsseljoch iuxta jugum Brenner, Tiroliae, leg. J. Murr). 3. Squama. 4. Pedunculus sub involucrio.

Subspecies **fuliginatum** Huter et Gander exs.! Oesterr. botan. Zeitschr. (1870) p. 338; *H. glanduliferum* 2. *fuliginatum* Arv.-Touv., Essai de Classificat. (1880) p. 6; *H. glanduliferum* × *piliferum* Hut. et Gand. in sched., *H. glanduliferum* × *villosum* Hut., Oesterr. bot. Zeitschr. l. c. — Inter *H. piliferum* et *H. glanduliferum* ssp. *hololeptum* N. P. quasi intermedia. Folia subglaucescentia, lanceolata v. anguste lanceolata acuta, saepe undulata. Caulis crassiusculus, rarissime furcatus. Pili involucri numerosi obscuri subsericei, in caule obscuri basin versus atri, breviores et densiores quam in subspecie priore, in foliis satis copiosi 3—4 mm longi, in exterioribus ± nulli. Glandulae in caule dispersae inter pilos subocculatae. Stylus luteus v. subobscurus. Flores lingulati, subtubulosi v. tubulosi in eodem capitulo.

Crescit in alpinis Helvetiae: in monte Grd. St.-Bernard, Simplon, Valserberg, Tiroliae: in monte Geisstein pr. Kitzbühel, in montibus circa jugum Brenner, in vallibus Ahrntal, Virgental, Iseltal, in alpe Nemesalp pr. Sexten. — Flor. Jul. Aug.

Exsiccata: Flora Austro-Hungarica no. 3332 I (sub nom. *H. piliferum* e monte Berghalpe in valle Virgental!), F. Schultz, Herb. norm. n. s. c. I no. 95 (1871).

Tab. 9, Fig. A. 1, 2. *H. fuliginatum* Huter. A. Planta (e monte Platzerberg ad jugum Brenner, leg. J. Murr). 1. Squama. 2. Pedunculus sub involucrio.

Species intermediae:

14. Hieracium dasytrichum Arv.-Touv., Monographie des Pilosella et des Hieracium du Dauphiné (1873) p. 25, Les Hieracium des Alpes françaises (1888) p. 36; Zahn in Koch Synopsis (1901) p. 1773 (sensu lato); *H. capnoides* A. Kerner apud N. P., Hierac. Mitteleurop. II (1889) p. 231 = **glanduliferum-villosum** N. P. l. c.

Dispositio gregum:

I. *Dasytrichum*. Involucri pilis obscuris sericeis et cum pedunculis glandulis raris v. dispersis vestiti; stylus obscurus; folia caulina 0—1. Inter *H. villosum* et *glanduliferum*.

II. *Capnoides*. Pili involucri albido-sericei; glandulae ubique nullae; stylus luteus; folia caulina 2—3. Inter *H. villosum* et *piliferum*.

II. Grex Capnoides.

Subspecies **dimidiatum** Huter! in sched., Zahn in Koch Synopsis (1901) p. 1773. — Caulis 25—28 cm altus, crassiusculus, subtiliter striatus, subflexuosus, profundissime furcatus 2-cephalus, pilis numerosis subsericeis albis vestitus, in parte superiore subcanotomentosus eglandulosus. Folia rosularia lanceolata, utrinque attenuata acutiuscula mucronulata, saepe subpetiolata, subundulata integerrima v. subdenticulata, flavescentia-viridia, utrinque molliter subpilosa; caulina c. 2; bractae in acladio 2—6 foliaceae. Capitula sat magna late globosa, demum depressa, ad 15 cm longa; squamae lineari-lanceolatae, exteriores saepe subfoliaceae adpressae virides, interiores obscurae, omnes longe acuminatae acutissimae, pilis numerosis albis sericeis basi obscuris 2—3 mm longis obsitae, apicem versus minutissime glandulosae, effloccosae. Flores lutei apice glabri, stylus luteus, achaenia matura castanea.

Crescit in monte Platzerberg! pr. Gossensass, Tiroliae. — Floret ab initio m. Aug.

Planta typica Huteriana ab nostra differt: statura minore, caule 1-cephalo, foliis pilis numerosioribus vestitis, capitulis dense villosis.

Tab. 10, Fig. A. 1—3. *H. dasytrichum* A.-T. ssp. *dimidiatum* Huter. A. Planta (e loco classico, leg. J. Murr). 2. Squama. 2. Ligula. 3. Pedunculus sub involucrio.

Subspecies **capnoides** A. Kerner! in sched. apud N. P. l. c. p. 233; *H. dasytrichum* c) *subpiliferum* Arv.-Touv. pp., Hierac. Alp. franç. p. 36. — Caulis 7—20 cm altus gracilis erectus rectus exstriatus. Folia rosularia complura, basin versus attenuata-subpetiolata, exteriora spathulata apice rotundata, interiora \pm oblongo-lanceolata acuta, subglaucescentia rigidiuscula integerrima saepe subundulata; caulina 2—3 parva lanceolata. Inflorescentia monocephala; involucrium 12—15 mm longum, ventricosum-globosum; squamae: exteriores sublatiusculae lineari-lanceolatae laxae, interiores angustiores lineares obscurae, omnes acutissimae. Pili involucri (3—4 mm l.) caulisque (5—7 mm l.) numerosissimi albi sericei, in foliis ubique numerosi mollissimi, 3—5 mm longi. Glandulae nullae. Flocci in involucrio foliisque nulli, caulis superne canotomentosus, usque ad basin leviter tomentosus. Flores saturate lutei, ligulae apice glabrae; stylus luteus; achaenia griseo-brunea, 2,8 mm longa, pleraque infertilia.

Crescit inter 2000—2300 m in alpinis Sabaudiae: Val Bona, Helvetiae: inter Fionney et alpe Louvie! in valle Bagnetal, in m. Catogne pr. Sembrancher, in alpinis supra Fully, Merezenbachalpe pr. Münster, Griesberg in v. Eginental, in monte Kalkberg supra Splügen; Algoviae: in montibus Hoefats; Tiroliae: inter Heiligkreuz et Vent in valle Oetzthal (loc. class. Kernerianus). — Floret Jul. Aug.

Tab. 10, Fig. B. 4—6. *H. dasytrichum* A.-T. ssp. *capnoides* A. Kerner. B. Planta (e loc. class., leg. R. de Benz). 4. Squama. 5. Ligula. 6. Pedunculus sub involucrio.

15. Hieracium diabolinum N. P., Hierac. Mitteleurop. II (1889) p. 235 = **cerinthoides** < **villosum** N. P. l. c.

Subspecies **diabolinum** N. P. l. c. — Habitus *H. scorzonrifolii* v. *H. villosi*. Caulis ad 45 cm altus gracilis erectus, inferne subflexuosus, superne subfractiflexus, subsquarrosoramosus. Folia rosularia ad 7, \pm petiolata, lanceolata v. latiora, obtusa, interiora acuta, denticulata v. remote sinuato-dentata, dilute viridia, mollia; caulina 4—8, modice decrescentia, infima in petiolum alatum attenuata, media basin versus subangustata sessilia, superiora latiora ovata, basi rotundata v. subcordata sessilia longe acuminata. Inflorescentia furcata (1—) 2—6 cephalae; acladium = $\frac{1}{5}$ — $\frac{1}{3}$ totius caulis; rami primarii (0—) 1—2 valde remoti graciles subarcuati erecti; ordines axium (1—) 2—3. Involucrium 12—14 (—17) mm longum, late cylindricum demum globosum speciosum. Squamae exteriores sublaxae angustae lineares acutissimae, interiores latae lanceolatae acuminatae obtusae v. obtusiusculae, interdum omnes acutae, olivaceo-atrae margine late pallidae. Bractae 4—5 remotae, omnes vel inferiores lanceolatae subfoliaceae v. lineares. Pili in involucrio subnumerosi diluti, 2—2,5 mm longi, in pedunculis modice numerosi 3—4 (—7) mm longi, in caulibus inferne satis numerosi rigidi horizontaliter patentes, 3—4 mm longi, in foliis supra sparsi v. modice numerosi rigidiusculi, 1,5—2,5 mm longi, subtus subnumerosiores molliores, in margine nervoque mediano subtus satis numerosi, 2—3 mm longi. Glandulae in involucrio et in pedunculis sparsae, in caulibus usque ad medium solitariae. Flocci in involucrio dispersi, squamae margine subfloccosae, caulomata superne canotomentosa, inferne multiflocca v. basin versus effloccosa; folia effloccosa. Flores dilute flavi, ligulae apice glabrae v. parum ciliatae; stylus luteus v. fuscescens; achaenia brunea, 3,5—3,8 mm longa, saepissime omnia fertilia.

Crescit inter 1350—1600 m in alpinis calcareis Pedemontii, Helvetiae: Creux de Champ! ad pedes montis Diablerets, Dent de Corjeon et Bonaudon! pr. Allières, in valle

Gasterental pr. Kandersteg!, inter Zermatt et Zmutt, in valle Lugnetz inter Campo et Vals-Platz!, in rupibus silvae Rheinwald pr. Nufenen, in montibus Jurae: Dôle, Rötiflüh et Creux-du-Van! — Floret Jul. Aug.

Variat: α) **genuinum** N. P. II p. 237. Folia caulina superiora e basi late ovata v. subcordata ovato-lanceolata, reliqua lanceolata basin versus attenuata. — Creux de Champ!

β) **megalodon** N. P. I. c. Folia omnia latiora, grosse dentata, infima lanceolata v. suboblunga, summa late ovata saepe subamplexicaulia; squamae omnes acutissimae; glandulae nullae; pili in pedunculis ad 7 mm longi. — Creux de Champ!

γ) **platyphyllum** N. P. I. c.; *H. scorzonrifolium* var. *insigne* Lager in sched. apud N. P. Folia radicalia saepissime oblonga v. elliptica, vix petiolata, caulina sessilia, media basi rotundata, superiora ovata. Bractee subfoliaceae. Squamae omnes latiusculae acutae v. intimae acutiusculae, effloccosae, parum glandulosae. Folia superne in margine tantum disperse pilosa. Achaenia 4–4,3 mm longa. — Dôle, Rötiflüh, Dent de Corjeon, Zermatt, Campo, Nufenen. — Habitus *H. villosi*.

Species nobilis; pro *H. cerinthoides* < *villosum* habent Naegeli-Peter, et ad interim hoc loco insero, sed forsitan intermedia inter *H. humile* et *H. villosum* (*humile* < *villosum*).

Tab. 11. 1–8. *H. diabolinum* N. P. ssp. *diabolinum* N. P. α) **genuinum** N. P. (e loco classico Creux de Champ. in Ormonts, leg. ipse). 1. Ligula. 2, 3. Squamae. 4. Pedunculus sub involucrio. 5, 6. Achaenium cum pappo. 7. Pilus pappi. 8. Margo folii portio.

Sectio IV. **Oreadea** Fries, *Epicrisis* (1862) p. 82 pp., A. Peter in Engler-Prantl, *Die natürlichen Pflanzenfamilien*, IV. Teil, 5. Abteil. (1894) p. 375–387, Zahn in Koch Syn. (1901) p. 1775. — Folia distincte petiolata, pilis simplicibus \pm denticulatis oblecta, praecipue radicalia in margine et in nervo dorsali minutissime et parcissime glandulifera, glauca saepe subpruinosa v. olivaceo-viridia, rigidiuscula, supra v. solum marginem versus et in margine rigide pilosa (ut in *H. pilosella*) subsetosa, basin versus \pm attenuata; caulina nulla v. 1–2 evoluta. Caulis alte furcatus v. laxo paniculatus, inflorescentia \pm indeterminata, oligo- v. pleiocephala. Capitula submediocria, \pm cylindrico-globosa; squamae irregulariter imbricatae, exteriores fere semper multo breviores, reliquae cito longiores aequilongae, omnes subpilosae, modice glandulosae, parce aut dense v. densissime floccosae, apice subbarbulatae; dentes ligularum ciliatae, stylus luteus, alveoli margine manifeste dentati v. fibrilloso-dentati, achaenia subatra.

16. Hieracium Schmidtii Tausch, in *Flora* (1828), *Ergänzungs-Blatt I* p. 65, Koch *Synopsis* ed. 2 (1844) p. 522, Grisebach, *Comment. de distr. Hierac. gen.* (1852) p. 57; *H. rupestre* Schmidt, N. Abhandl. Böhm. bot. Gesellsch. I (1790) p. 58, tab. 9 (forma spithamea monocephala, pr. Raditsch ad fl. Moldau lecta = *H. Schmidtii* ζ) *uniflorum* Tsch. I. c.), non All.; *H. Sternbergii* Froel. in De Cand., *Prodr.* tom. VII (1838) p. 214; *H. pallescens* Wimmer, *Flora v. Schlesien* ed. 3 (1857) p. 309, non W. Kit.; *H. pallidum* Fries, *Symbolae* (1848) p. 94 et *Epicrisis* (1862) p. 83 apud Gussone, *Florae Siculae Syn.* II (1842–43) p. 404, an Bivona fil., *Nuov. piant. ined.* (1813) p. 11? (caule pumilo 2–3 foliato, ex Gussone loc. cit.); *H. Gougetianum* Gren. et Godr., *Flore de France* II (1850) p. 368 pp.; *H. murorum* η Janus Gren. Godr. I. c. p. 372 pp.

Dispositio gregum:

I. *Schmidtii*. Folia caulina 0–1, rarissime 2, omnia subtus effloccosa. Squamae non longe acuminatae, parum floccosae, olivaceo-obscurae.

II. Crinigerum. Folia caulina 2—3 (—4) evoluta, reliqua ut in I. Planta in parte inferiore saepissime pilis rigidis copiosis sat longis oblecta. Inter *H. Schmidtii* Tausch et *H. onosmoides* Fries quasi intermedia.

III. Rupicolum. Folia caulina 0 (—1), omnia subtus \pm floccosa. Squamae angustae longe acuminatae cum pedunculis dense floccosae v. canotomentosae.

II. Grex Schmidtii.

Subspecies **cyaneum** Arv.-Touv., Hierac. Alp. franç. (1886) p. 69; *H. pallidum* Fries l. c. pp.; *H. Schmidtii* Tausch l. c. et mult. pp.; *H. comatulum* Jordan apud Boreau, Flore du Centre de la France 3. éd. (1857) p. 410, non N. P. — Caulis 20—50 cm altus subglandulosus, saepe epilosus v. subsetoso-pilosus, apice laxe paniculatus v. alte furcatus oligo- v. pleiocephalus. Folia glauco-viridia v. pallide glauca, interdum submaculata, elliptica, oblonga aut lanceolata, basin versus angustata rarius contracta longe petiolata, denticulata v. dentata basin versus saepe grosse dentata, supra glabra vel margine tantum \pm longe setoso-pilosa, subtus pallidiora disperse pilosa, in margine nervoque dorsali et in petiolo subrigide pilosa; caulina 0—1 angustata subpetiolata. Rami primarii 1—3 remoti suberecti, ordines axium 2—3, acladium 20—30 mm ($-\frac{1}{3}$ totius caulis); involucrium obscurum 9—11 mm longum ovato-cylindricum v. ovatum, basi rotundatum; squamae angustae acutae v. acutiusculae subpilosae v. parcepilosae, dense et breviter v. satis longe (saepe nigro-) glandulosae subfloccosae v. fere effloccosae; pedunculi superne subdense glandulosi \pm canotomentosi aut subfloccosi. Flores dilute lutei, ligulae apice subciliatae; stylus luteus, achaenia matura \pm atra.

Crescit in alpihus graniticis et schistosis Delphinatus, Sabaudiae, Vallesiae (inter 500—2000 m), in montibus Vogesorum, in monte Donnersberg Palatinatus, in Silva Nigra pr. Schramberg, in montibus Rhoen, in Saxonia, Silesia, Bohemia, Austria inferiore etc. — Floret Maio-Jul.

Tab. 12. 1—5. *H. Schmidtii* Tausch ssp. *cyaneum* Arv.-Touv. Planta (e monte Donnersberg, leg. ipse). 1. Squama. 2. Alveolum. 3. Ligula. 4. Caulis portio. 5. Margo folii portio.

Seccio V. **Vulgata** Fries, Epicrisis Hierac. (1862) p. 7 et 89 pp.; Peter in Engler-Prantl, Natürliche Pflanzen-Familien IV, 5 (1894) p. 375—387; Zahn in Koch Synops. (1901) p. 1779. — Folia distincte petiolata, pilis simplicibus \pm denticulatis oblecta, eglandulosa (rarissime una vel altera glandula sub lente mihi obvia), gramineo-vel dilute viridia, rare glaucescentia, saepissime mollia, ubique vel solum in margine et subtus molliter et subcrispopilosa, basi cordata, truncata, rodundata vel \pm attenuata; caulina aut 0—1 (—2) et caulis scapiformis (*H. silvaticum* L.), aut complura (*H. vulgatum* Fr.). Inflorescentia \pm determinata paniculata, rarius furcata, oligo-vel polycephala. Capitulae et squamae ut in seccio IV, glandulosae et pilosae vel solum glandulosae, fere semper \pm floccosae; dentes ligularum non ciliatae v. subciliatae; stylus obscurus rarius luteus; alveoli margine edentati v. parum dentati; achaenia \pm atra.

17. **H. silvaticum** L. Species plantarum ed. I (1753) p. 803, ed. II (1763) p. 1128 (pro var. *H. murorū*); Fries, Epicrisis (1862) p. 91, Zahn in Koch Synops. (1901) p. 1779; *H. murorum* Auct. plur., Fries, Symbolae (1848) p. 108, Grenier et Godron, Fl. de France II (1850) p. 372; *H. silvaticum* et *murorum* Peter l. c.

Dispositio gregum:

1. Involucrum 13—14 mm longum ovatum crassiusculum.
- I. Prasiophaeum. Tota planta prasino-viridis glaucescens; folia rigidiuscula basin versus profunde vel inciso-dentata, supra glabra saepe \pm bruneo-maculata, marginem versus, in margine ipso et in nervo dorsali petioloque longe et molliter albo-pilosa subvillosa; caulina 1—2, basi saepe subvaginantia. *Transitus Eusilvaticum* \rightarrow *Cerinthoidea*, *habitus H. silvatici*.
2. Involucrum 9—12 mm longum cylindrico-ovatum v. \pm cylindricum.
 - a. Folia \pm glaucescentia v. glauca.
- II. Heteroschistum. Folia supra vel saepissime in margine tantum subsetaceo-pilosa, ovata basi \pm cordata v. truncata; inflorescentia altefurcata pleiocephala, involucrum solum glandulosum v. pilis solitariis immixtis, stylus obscurus. Inter *H. cinerascens* Jord. et *Eusilvaticum* quasi intermedium (*Schmidtii* \ll *silvaticum*).
- III. Praecox. Folia supra glabra (autumnalia saepe subpilosa), bruneo-maculata, in margine et subtus submolliter pilosa, ovata, basi truncata v. attenuata et \pm grosse dentata; inflorescentia altefurcata v. laxe paniculata oligocephala v. pleiocephala; involucrum glandulosum et pilis parvis vel subnumerosis dilutis v. obscuris oblecta, stylus luteus, ligulae apice saepissime subciliatae.
 - b. Folia dilute v. gramineo- v. saturate viridia interdum subglaucescentia.
- IV. Bifidiforme. Folia gramineo-aut saturate viridia, parum pilosa supra saepissime epilosa, interdum submaculata, ovata v. oblongo-lanceolata, basi subcordata, truncata aut subattenuata, \pm dentata laciniatave, inflorescentia subfurcata v. laxe paniculata oligocephala; involucrum multifloccum v. leviter tomentosum, omnino glandulosum v. pilis sparsis immixtis, squamae saepe obtusiusculae, stylus luteus v. obscurus, ligulae apice glabrae. *Transitus Eusilvaticum* \rightarrow *bifidum*.
- V. Pleiotrichum. Folia gramineo-viridia saepe sublutescentia interdum subglaucescentia, utrimque subpilosa v. supra glabrescentia, cordato-ovata aut oblongo-lanceolata et basi \pm attenuata, dentata v. grosse dentata; inflorescentia altefurcata v. laxe paniculata oligocephala, involucrum parvifloccum, squamae nigrae longe acuminatae acutae, pilis glandulisque obscuris fere aequaliter mixtis, stylus obscurus, ligulae subspeciosae saepissime apice glabrae. *Transitus incisum* \rightarrow *Eusilvaticum*.
- VI. Cirritoides. Folia dilute viridia v. sublutescenti-viridia subpilosa ovata aut late lanceolata, basi truncata attenuatave, dentata v. laciniata basi subpinnatifida; inflorescentia altefurcata v. laxe paniculata oligocephala, involucrum fere semper \pm floccosum, squamae subobscurae angustae, longe acuminatae acutae, glandulis subdensis et pilis parum numerosis crispis apice dilutis basi atris oblectae (raro squamae omnino epilosae), stylus obscurus, ligulae minores ut in V, apice glabrae et saepe obscurius flavae. *Transitus cirritum* \rightarrow *Eusilvaticum*.
- VII. Pleiophylloides. Folia sublutescentia-viridia mollia utrinque pilosa, oblonga v. subovata basi rotunda truncatave, raro subcordata, dentata v. grosse et repando-dentata; inflorescentia paniculata polycephala, involucra elongata subcylindrica squamis angustis obscure olivaceis epilosis subfloccosis dense et breviter glandulosis. Pedunculi caulesque superne dense et breviter glandulosi et subcanotomentosi, fere usque ad basin multiflocci. *Transitus pleiophyllum* $<$ *Eusilvaticum*.
- VIII. Atropaniculatum. Folia saturate v. gramineo-viridia subpilosa, saepe in margine glandulis solitariis minutis obsita, ovata oblongave basi subcordata v. truncata, \pm dentata; inflorescentia laxe paniculata pleiocephala; involucri squamae latiusculae nigrae parum floccosae, glandulis nigris longioribus dense obsitae, pedunculi caulesque superne nigro-glandulosi, stylus obscurus, ligulae saepe subglabrae v. glabrae. *Transitus Eusilvaticum* \rightarrow *atratum*.
- IX. Eusilvaticum. Folia \pm viridia mollia, cordato-ovata, ovalia v. oblonga, interdum oblongo-lanceolata, basi cordata, truncata, interdum subdecurrentia, utrinque pilosa v. supra glabrescentia, dentata basi grosse retrodentata, serrato-dentata v. sublaciniata v. multidentata v. etiam denticulata aut repando-dentata; inflorescentia paniculata pleio- v. polycephala, raro oligocephala, squamae angustae v. latiores, acutae v. obtusiusculae, apice saepe barbulate, subeffloccosae

nigrae v. \pm floccosae epilosae, semper cum pedunculis et caulibus superne dense et conspicue nigroglandulosae, stylus obscurus, ligulae apice glabrae v. parum ciliatae. Haec grex *centrum H. silvatici* sistere censeo.

- X. *Exotericum*. Folia dilute viridia, saepe tenuia, pilosa aut subglabra; stylus luteus, reliqua ut in IX, glandulae saepe tenuissimae.
- XI. *Oblongum*. Folia viridia v. obscure viridia, oblongo-lanceolata v. sublanceolata, utrinque attenuata (more *H. vulgati*), basi brevius v. protractius cuneiformia, denticulata v. serratodentata, caulina 1—2 \pm lanceolata; reliqua ut in IX; stylus obscurus v. saepe luteus. *Transitus Eusilvaticum* \rightarrow *divisum* (*silvaticum* \gg *vulgatum*).
- XII. *Crepidiflorum*. Folia sublutescenti- v. gramineo-viridia subpilosa v. glabrescentia, oblonga basi truncata v. subdecurrentia, denticulata dentata v. caulina 1—2 (3) basi subvaginantia; inflorescentia patenti-paniculata pleio- v. polycephala, squamae pedunculique densissime glandulosae, stylus obscurus, ligulae apice interdum subciliatae. *Transitus Eusilvaticum* \rightarrow *Juranum*.

3. Involucrum 7—9 mm longum, tenue, gracile cylindricum.

- XIII. *Tenuiflorum*. Caulis tenuis; folia mollia \pm pilosa, ovata v. oblongo-lanceolata, truncata v. subdecurrentia, denticulata v. dentata v. grosse repando-dentata; inflorescentia oligocephala v. pleiocephala, squamae angustae acutae v. acutiusculae, (cum pedunculis) glandulosae et pilosae v. solum glandulosae, parum floccosae v. subfloccosae. — Plantae gracillimae, in Italia superiore et in Helvetia australi non infrequentes, constanter (non pathologice) microcephalae.

4. Involucrum virescens, 10—12 mm longum, squamis latiusculis distincte obtusis.

- XIV. *Grovesianum*. Folia sordide virentia subcoriacea, ovata basi truncata v. parum decurrentia, \pm dentata margine ciliato, caulina 0—1; squamae pedunculique glandulis mediocriter numerosis brevibus parum conspicuis vestitae, stylus fuliginosus, ligulae ochroleucae apice glabrae. *Transitus Eusilvaticum* \gg *Italica*. — Prope Florentiam.

I. Grex *Prasiophaeum*.

Subspecies ***prasiophaeum*** Arv.-Touv. et Gautier, Hierac. nouv. pour la France ou p. l'Espagne, in *Bullet. Soc. bot. France*, tome XLI (1894) p. 349; Zahn in Koch *Synops.* (1901) p. 1780. — Caulis 40—50 cm altus gracilis v. crassus, \pm sparse et breviter pilosus subfloccosus, superne sparse v. modice glandulosus. Folia rigidiuscula, radicalia c. 6 longe petiolata, exteriora elliptica minora subobtusa, reliqua majora magis elongata, elliptico-lanceolata v. oblongo-lanceolata, utrinque abrupte v. sensim attenuata acuta mucronata, dentata v. grosse multidentata, basin versus laciniata v. pinnatifida, supra glabra lucida, prasino-viridia glaucescentia saepe subpruinosa v. etiam \pm maculata, subtus pallida disperse pilosa, in margine nervoque dorsali et praecipue in petiolo molliter albopilosa subvillosa, in nervo dorsali subfloccosa; caulina 1—2, breviter petiolata v. subattenuata sessilia subvaginantia acuta, superius lineari-lanceolata. Inflorescentia determinata squarroso-paniculata, (2—) 6- pleiocephala, aeladium 2—3 cm longum, rami primarii 2 v. complures graciles, involucrum crassiusculum ovatum, 13—14 mm longum, squamae subangustae acutae nigricantes pallide marginatae, subfloccosae, densissime et obscure glandulosae pilis obscuris parum numerosis immixtis, pedunculi canotomentosi densissime glandulosi. Flores pallide lutei ochroleuci. stylus luteus demum fuscescens, ligulae apice saepe ciliatae; achaenia nigricantia, 3—3,5 mm longa.

Crescit in Pyrenaeis gallicis et hispanicis, in Helvetia: pr. Turicum (in muris ad fl. Sihl, leg. Kaeser)!, in Germania australi in lapidicinis pr. Durlach (leg. ipse)!, in Jura franco-nico in monte Staffelberg pr. Staffelstein (leg. Dr. Harz)!. — Floret Maio-Jun.

Exsiccata: Arv.-Touv. et G. Gautier, Hieraciotheca gallica no. 50—53, 238—244!

Tab. 13. *H. prasiophaeum* Arv.-Touv. (planta helvetica). 1. Squama. 2. Apex squamae. 3. Ligula. 4. Portio caulis. 5. Achaenium cum pappo. 6. Margo folii portio.

III. Grex Praecox.

Subspecies **glaucinum** Jordan, Catalogue des grains du Jard. bot. de Dijon (1848) p. 22 et apud Boreau, Flore du Centre de la France 3 éd. (1857) p. 410; *H. fragile* v. *mucronatum* Godr. et Grenier, Fl. d. France II (1850) p. 373; *H. praecox* v. *fragile* Arv.-Touv., Les Hieracium des Alpes franç. (1888) p. 81 ex p., Zahn in Koch Syn. (1901) p. 1781; *H. praecox* ssp. *fragile*, microspecies *glaucinum* Sudre, in Les Hierac. Centre France (1902) p. 85; *H. murorum* γ *plumbeum* Griseb., Comment. distr. Hierac. gen. (1852) p. 37 ex p. — Planta 3—5 dm alta, dilute viridis glaucescens. Folia petiolata ovata aut oblongo-lanceolata basi subcordata v. \pm contracta et subdecurrentia, obtusa v. acuta mucronata, saepe praecipue basin versus grosse et longe dentata, dentibus mucrone glanduliformi terminatis, supra glabra saepissime bruneo-maculata, in margine nervoque dorsali et in petiolo pilis submollibus breviter subvillosa; caulina 0—1. Inflorescentia laxa paniculata v. altefurcata subsquarrosa oligo- v. pleiocephala; involucrum 10—12 mm longum crassiusculum ovatum, squamae subangustae acutae obscurae submarginatae, pilis subnullis v. paucis, glandulis densissimis atris et floccis parum numerosis obsitae, pedunculi canotomentosi dense nigro-glandulosi fere pilosi. Flores lutei, ligulae apice profunde dentatae subglabrae; achaenia atra.

Crescit in collibus et ad margines silvarum et in lapidicinis Galliae centralis, Helvetiae austro-occidentalis, Germaniae australis inter Schaffhausen, Basel et Bingen, Moraviae etc. — Flor. jam Maio, Jun.

H. fragile Jord., Observ. pl. crit. VII (1849) p. 34, Boreau l. c. p. 410, Godr. et Grenier l. c. p. 373, Fries Epicr. p. 93, huic simillimum est, sed folia latiora pilis rigidiusculis marginem versus obsita, capitula dense glandulosa et saepe subpilosa. Specimina *H. glaucini* et *fragilis* e manu cl. Jordan a me visa non conspicue different.

Exsiccatae: Arv.-Touv. et G. Gautier, Hieraciotheca gallica no. 648.

Tab. 14. *H. glaucinum* Jord. (planta badensis, in pinetis sabulosis planitiae rhenanae pr. Waghaeusel a me lecta). 1, 2, 3. Squamae. 4. Dentes ligulae. 5. Caulis portio. 6. Margo folii portio.

VI. Grex Cirritoides.

Subspecies **cirritoides** Zahn, in Koch Syn. (1901) p. 1782; *H. murorum* var. *subatratum* Arv.-Touv. pp. in sched. — Caulis ad 40 cm altus gracilis, inferne pilosus, supra medium disperse et \pm longe glandulosus et leviter tomentosus, inferne saepe usque ad basin subfloccosus. Folia radicalia c. 5, longe petiolata, ovata basi subcordata v. truncata saepe subattenuata, obtusa v. acuminata acuta, supra sparse subtus modice pilosa, in margine nervoque dorsali et etiam in petiolo pilis copiosis tenuissimis molliter pilosa, supra saturatae viridia, subtus sordide viridia pallidiora, praecipue basin versus grosse pluridentata apicem versus integerrima; caulinum 0—1 \pm petiolatum, rhomboideo-lanceolatum in petiolum attenuatum aut lineari-lanceolatum acutissimum. Inflorescentia laxa paniculata suprafastigiata oligocephala, acladium ad 30 mm longum, rami primarii 1—2 (—3) remoti, involucrum 10—12 mm longum, squamae angustae, intimae acutissimae, dilute marginatae, parum floccosae, dense glandulosae, pilosae v. pilis dispersis breviter pilosae, pedunculi subdense glandulosi saepe pilosi canotomentosi. Flores lutei apice saepe saturate lutei glabri, stylus obscurus, achaenia atra.

Crescit inter 1600—2200 m in alpihus elatioribus Pedemontii: Vallée de Cogne!

Grd. St.-Bernard: aux Combes!; Helvetiae: Martigny!, Alpes de Bex!, Simplon!, Eginental!, Valserberg! Tiroliae: in iugo Sellajoch! — Flor. Jul. Aug.

Variat capitulis maioribus minoribus, squamis \pm floccosis, foliis \pm pilosis v. glabratissimis etc.

Tab. 15. *H. cirritoides* Zahn (e monte Valserberg pr. Hinterrhein, Rhaetiae, leg. ipse).
1, 2. Squamae involucri. 3. Dentes ligulae. 4. Caulis portio. 5. Achaenium cum pappo.
6. Limbi folii portio.

XII. Grex *Crepidiflorum*.

Subspecies **subditivum** Murr et Zahn, Allgem. bot. Zeitschr. (1904) p. 99. — Caulis 20—50 cm altus strictus, basi saepe subrubescens. Folia saturate viridia breviter subpilosa v. supra omnino glabra, basi grosse dentata, in medio subdentata apicem versus denticulata, oblonga v. oblongo-lanceolata basi truncata vel utrinque attenuata; caulina 1—2, basi in petiolum \pm alatum subvaginantem attenuata v. subattenuata sessilia parum amplexicaulia. Inflorescentia subsquarroso-ramosa pleiocephala, rami primarii 2—3 (—4) remoti, accladium ad 20 mm longum; capitula ut in archetypo, squamae sublatiusculae obtusiusculae obscurae, cum pedunculis cauleque superne dense et satis longe nigroglandulosae, glandulae saepe usque ad medium caulis subnumerosae. Flores lutei, ligulae apice subglabrae, stylus obscurus, achaenia atra.

Crescit in Alpibus locis graminosis v. subsilvaticis et in subalpinis inter *H. Juranum* Fries vel *H. subalpinum* Arv.-Touv. et *H. silvaticum*, a quibus forsan originem trahit idque ita, ut *H. Juranum* cum *H. silvatico* (Grex Eusilvaticum) *H. subalpini* et *H. crepidiflori* formis quasi uno tractu conjungantur. — Floret Jul. Aug.

Variat β) **silvaticifolium** Zahn l. c. Folia oblonga basi truncata. — In valle Jaufen-tal p. Sterzing, Tiroliae (leg. J. Murr).

γ) **extenuatum** M. et Z. l. c. Folia oblongo-lanceolata basi attenuata in petiolum decurrentia. — Ibidem.

Forma primaria gregis *Crepidiflorum* est *H. crepidiflorum* Polak, in Oesterr. bot. Zeitschr. (1884) p. 155 e subalpinis Sudetorum (Riesengebirge: Kleiner Teich, Grosse Schnee-grube etc.). Aliae formae *H. crepidiflori* in Helvetia: Grd. St.-Bernard, Martigny, Alpes de Grd.-Villars (Gruyère), Simplon, Eginental, Samnaun; Tirolia: Jaufen pr. Sterzing, Plaetz-wiesen pr. Alt-Prags, Ahrntal; Vorarlbergia: Alpe St. Rochus in valle Gamperdonatal.

Tab. 16. *H. subditivum* γ) *extenuatum* M. et Z. (Jaufen-tal). 1. Squama. 2. Dentes ligulae. 3. Caulis portio. 4. Limbi folii portio.

Grex IV. Bifidiforme.

Subspecies **bifidiforme** Zahn, in Reichb. Icon. tom. XIX 2 p. 17 (1905) et in Schinz et Keller, Fl. d. Schweiz ed. 2 (1905). — Inter *H. bifidum* Kit. et *H. silvaticum* L.; habitus *H. bifidi*, indumentum *H. silvatici*. Caulis 40—50 cm altus gracilis substriatus, supra medium multifloccus v. leviter tomentosus et parce glandulosus v. eglandulosus, inferne denudatus floccosus et (praecipue basin versus) breviter subpilosus. Folia radicalia satis longe petiolata, ovata basi subcordata et breviter decurrentia vel truncata et subdecurrentia v. etiam basi contracta in petiolum satis longe decurrentia, obtusa v. interiora subacuminata acuta, dentata v. praecipue basin versus grosse dentata subsinuata v. subpinnatifida, gramineo-viridia subtus pallidiora aut subglaucescentia, submolliora aut rigidiora, autumnalia saepe subcoriacea, supra

fere semper glabra rarius marginem versus parcepilosa, subtus breviter parcepilosa, in margine nervoque dorsali et etiam in petiolo pilis parum numerosis brevibus v. magis elongatis numerosioribus molliter pilosa; caulina 1 (—2), inferius subpetiolatum lanceolatum vulgo grosse dentatum et longe acuminatum, superius lineari-lanceolatum v. subulatum. Inflorescentia laxa paniculata v. altefurcata (ut in formis *H. bifidi*) oligocephala rarius pleiocephala, acladium (10—) 20—50 mm ($-\frac{1}{3}$ totius caulis), rami primarii 1—3 valde remoti arcuato-patentes v. erecti; involucrum (8—) 10—12 mm longum, squamae angustae, exteriores obtusiusculae, interiores acutiusculae v. acutae, obscure olivaceae dorso saepe subatrae, margine \pm virides, subfloccosae v. multiflocae, sat dense glandulosae, fere semper epilosae, pedunculi cano- v. albotomentosi epilos, subglandulosi v. fere eglandulosi. Flores saturate lutei apice glabri, stylus obscurus, achaenia castanea v. matura atra.

Crescit in consortio *H. bifidi* Kit. (*H. subcaesium* Fries et auct.) in Helvetia: Martigny (Pacoteires! sur Alesse, 2000 m, leg. M. Besse), in jugo Simplonpass!, 1900 m (leg. E. Favre), in Ormonts! et pr. Kandersteg! (leg. Touton), in alpinis friburgensibus: Les Morteys! (leg. Jaquet), in valle Sertigtal pr. Davos et in monte Kalkberg supra Splügen (leg. ipse); Tirolia meridionalis: pr. Trient! (leg. Murr). In alpinis Hungariae! Dalmatiae! Croatiae! et Bosniae! — Floret Jul.—Aug.

Tab. 17, Fig. A. 1—5. *H. silvaticum* L. ssp. *bifidiforme* Zahn. A. Planta (e monte Simplon). 1. Squama. 2. Pedunculus sub involucri. 3. Ligula. 4. Stylus. 5. Pilus stellatus.

Grex XIII. Tenuiflorum.

Subspecies **tenuiflorum** Arv.-T., in Cl. Bicknell, Fl. of Bordighera and S. Remo (1896) p. 173; *H. praecox* v. *tenuiflorum* Arv.-T. in herb. Chenevard. — Caulis (10—) 20—35 (—40) cm altus tenuis, inferne molliter pilosus, superne epilosus v. parcepilosus canotomentosus, modice v. sat dense et tenuiter glandulosus. Folia mollia tenuia, ovata v. oblongo-lanceolata, subobtusata v. acuta, basi truncata v. subdecurrentia saepe subcordata brevius longiusve petiolata, denticulata v. dentata saepe (praecipue basin versus) grosse repando-dentata, gramineo- v. saturate viridia subtus pallidiora, utrimque subpilosa v. supra \pm glabra, subtus in nervo dorsali et praecipue in petiolo densius pilosa v. in petiolo subvillosa; caulina 0—1 (—2) breviter petiolata v. attenuata sessilia saepe longe lineari-lanceolata. Inflorescentia \pm determinata paniculata saepe subumbellata, in formis autumnalibus interdum etiam \pm furcata, (2—) 5—10 (—20) cephala, acladium vulgo 5—20 (—30) mm longum, rami primarii tenues erecti, (1—) 2—5 (—7) saepe conferti aut inferiores (1—2) remoti; involucrum (5—) 7—9 mm longum tenue anguste cylindricum, squamae angustae acutiusculae saepe acutae, interdum etiam obtusiusculae, apice subbarbulatae, dorso obscurae v. \pm atrae, subfloccosae, dense et tenuiter glandulosae, epilosae v. etiam parcepilosae, rarius subpilosae, pedunculi tenuissimi canotomentosi, subdense et saepe breviter glandulosi. Flores lutei, stylus demum fuscescens, ligulae apice glabrae, achaenia demum atra.

Crescit inter 200—1850 m in Italia superiore pr. Como, Lecco, Bellano, in vallibus Sassina, Varrone, in monte Legnone, in monte Generoso etc.; in Helvetia australi in valle Leventina pr. Faido, Biasca, Bellinzona, in montibus Mte Camoghé, Mte Ceneri etc.; in Valesia: Simplon (in valle d'Ossola usque ad Lacum Maiorem); in Rhaetia engadinensi in monte Ofenberg inter Zernetz et Cierfs. — Floret Maio-aestate.

Variat: α) **genuinum**. Involucri pedunculique epilosii.

a) *verum*. Folia utrinque pilosa. — Non infrequens.

b) *glabrescens*. Folia supra fere pilosa. — Prope Lugano etc.

β) **pilosiceps**. Involucri pedunculique parcepilosi. — Prope Lugano.

Variat etiam foliis utrinque pilosis v. glabrescentibus.

Tab. 17, Fig. B. 6—8. *H. silvaticum* L. ssp. *tenuiflorum* Arv.-T. (planta helvetica e monte Simplon, leg. Chenevard). 6. Squama. 7. Pedunculus sub involucrio. 8. Caulis portio (pars superior).

18. Hieracium divisum Jordan, Catalogue des grains du Jardin bot. de Dijon (1848) p. 21, et apud Boreau, Fl. du centre de la France (1857) p. 406, Sudre, Hierac. centr. France (1902) p. 62 pp.; *H. umbrosum**) Zahn, in Koch Synops. (1901) p. 1785 = **silvaticum-vulgatum** Zahn l. c.

Dispositio gregum:

- I. Medianum. Habitus *H. silvatici*; folia saturate viridia parcepilosa, basin versus \pm attenuata et \pm dentata, in petiolum subdecurrentia, immaculata; basalia oblonga obtusa aut \pm late lanceolata, caulina 2—4 breviter petiolata; caulis saepe iam infra medium in ramos elongatos erectos divisus; involucrum omnino glandulosum, rarissime pilis solitariis immixtis. — Huc pertinent *H. medianum* Griseb., *H. faucium* Sudre etc.
- II. Divisum. Habitus *H. silvatici*; folia \pm glaucescentia- (saepe sublutescenti-) viridia, supra glabra v. saepe subpilosa, sat magna, breviter v. sensim in petiolum attenuata, basin versus grosse dentata, immaculata rarius submaculata; basalia oblonga v. oblongo-lanceolata margine pilosa, caulina 2 (—3) remota basi cuneiformia et vulgo inciso-dentata; caulis ex alis superioribus v. iam a basi in ramos saepe valde elongatos erectos divisus; involucrum sat magnum pilis glanduliferis simplicibusque subaequaliter mixtis obsitum, rarius fere omnino glandulosum. — Huc pertinent *H. divisum* Jord., *H. Pollichiae* Sch.-Bip. etc.
- III. Onosmotrichum. Habitus *H. silvatici*; folia utrinque caulesque praecipue basin versus dense et subrigide pilosa (more *H. onosmoidis* Fr.), immaculata, basalia numerosa ovalia v. oblonga basi rotundata v. interiora subcuneiformia, a medio ad basin acute serrato-dentata, caulina 2 remota radicalibus similia, omnia rigidiuscula sublutescenti-viridia subglaucescentia; inflorescentia squaroso-paniculata, involucrum sat magnum, cum pedunculis dense et sat longe glandulosum epilosum. — Huc pertinet *H. onosmotrichum* Zahn.
- IV. Arenarium. Habitus *H. vulgati*; folia \pm glaucescentia, supra saepissime glabra et distincte bruneo-maculata, lanceolata v. oblongo-lanceolata utrinque attenuata in petiolum decurrentia, vulgo grosse dentata vel subincisa, caulina 2—4, saepe irregulariter serrato-dentata v. basin versus laciniata, rarissime folia minus profunde dentata v. denticulata; caulis ex alis superioribus v. iam supra basin in ramos \pm valde elongatos erectos divisus; involucrum cum pedunculis pilis longioribus simplicibus et glanduliferis brevioribus varie numerosis hirtum, rarissime fere solum glandulosum. Inter *H. vulgatum* Fr. et *H. praecox* Sch.-Bip. — Huc pertinent *H. cruentum* Jord. (non N. P.**), *H. arenarium* Sch.-Bip., *H. tinctum* Jord., *H. asperatum* Jord. etc.
- V. Commixtum. Habitus *H. vulgati*; folia saturate v. obscure viridia, vulgo parce pilosa, immaculata, omnia lanceolata utrinque attenuata, subaequaliter dentata v. denticulata, saepe submollia, caulina 2—3 radicalibus similia; caulis superne in ramos saepe elongatos erectos divisus, involucrum glandulosum et \pm pilosum v. tantum glandulosum. — Huc pertinent *H. commixtum* Jord., *H. pseudopollichiae* Oborny et Zahn etc.

*) Hoc nomen receperam ex Fries, Epicrisis p. 98 (qui vidit plantam Jordanianam sub nomine *H. umbrosum* in Catal. Dij. p. 24 enumeratam) et ex Gren. Godr., Fl. de France 2 p. 374; sed praefero nunc nomen antiquius et non dubiosum „*divisum*“.

**) *H. cruentum* N. P. (1886), non Jord. (1849) = *H. rubellum* (Koch Syn. ed. 2 II, anno 1844. p. 516, pro var. *H. sabini*) Zahn, in Schinz et Keller, Flor. d. Schweiz, 2 ed. (1905).

II. Divisum.

Subspecies **Pollichiae** Schultz-Bip., in Österr. bot. Wochenblatt (1853) p. 247, F. Schultz, Archives de Flore (1854—1869) p. 22 et 232; *H. praecox oxydontoides* Sch.-Bip., in Pollichia IX (1851) p. 40; *H. pallescens* var. *Pollichiae* Arv.-Touv., in Hierac. Alp. franç. (1886) p. 84; *H. divisum* ssp. *divisum* subvar. *Pollichiae* Sudre, in Hierac. Centr. France (1902) p. 69. — Caulis 40—50 cm altus crassiusculus, inferne subviolaceus dense et molliter pilosus subvillosus, superne subpilosus subglandulosus parce floccosus, saepe angulato-striatus. Folia radicalia c. 4 satis longe petiolata, obovata-spathulata v. ovalia v. elliptica, apice rotundata obtusa aut acutiuscula, basi ± attenuata et in petiolum ± decurrentia, supra glabra glaucescentia, dilute et sublutescenti-viridia, subtus pallidiora, in margine et subtus praecipue in nervo dorsali et in petiolo submolliter subdenseque ciliata, acute dentata apicem versus denticulata; caulina 1—2 (—3) remota sat magna, radicalibus similia saepe magis dentata, in petiolum brevem alatum contracta. Inflorescentia valde suprafastigiata, (1—) 5—10 (—15) cephalis, accladium ad 30 (—40) mm longum, rami primarii (1—) 2—3 (—4) remoti valde elongati oblique erecti, ordines axium 4; involucrium 10—12 mm longum ovatum demum basi truncatum depressum, obscurum, squamae subangustae attenuatae acutiusculae intimae acutae, dorso obscurae margine olivaceo-virides, fere effloccosae, glandulis sat numerosis et pilis longioribus sparsis v. subnumerosis sordide albidis v. subobscuris vestitae, pedunculi multiflocci v. leviter tomentosi, dense glandulosi subpilosi. Flores dilute flavi, stylus demum obscurus, ligulae apice fere semper glabrae, achaenia matura atra.

Crescit in castanetis et ad silvarum margines Germaniae australis: Palatinatus, inter Neustadt et Dürkheim (loc. class.), Alsatie sup., in collibus subsilvaticis pr. Barr!, in Gallia centralis. — Floret Maio-Jun.

Variat: 1) *normale*. Folia supra glabra.

a) *verum*. Folia immaculata. Palatinatus.

b) *submaculatum*. Folia supra leviter maculata. Palatinatus, Gallia centralis.

2) *virescens* Zahn, in Koch Synops. (1901) p. 1786. Folia supra praecipue marginem versus subpilosa v. pilis parum numerosis obsita. Palatinatus, Alsatia.

Exsiccata: F. Schultz, Herbarium normale, cent. I no. 97!

Tab. 18. 1—3. *H. divisum* Jord. ssp. *Pollichiae* Sch.-Bip. 1) *normale* a) *verum* (e monte Waldburg supra Deidesheim, Palatinatus, leg. ipse). 1. Squama. 2. Pedunculus sub involucrio. 3. Caulis portio.

IV. Arenarium.

Subspecies **arenarium** Schultz-Bip., in Pollichia XIII (1855) p. 23, F. Schultz, Archives de Flore (1854—1869) p. 22 et 232; *H. caesium maculatum* Sch.-Bip., in Pollichia X (1852) p. 24 et 28; *H. vulgatum-murorum* F. Schultz l. c. p. 22; *H. pallescens* c) *arenarium* Arv.-T., Hierac. Alp. franç. (1886) p. 84; *H. praecox-vulgatum* Zahn, in Koch Synops. (1901) p. 1786; *H. divisum* Jord. ssp. *divisum* subvar. *arenarium* Sudre, Hierac. Centr. France (1902) p. 69. — Caulis 30—45 cm altus gracilis saepe rigidus substriatus, inferne vulgo purpureo-violaceus et subvillosus, superne modice pilosus eglandulosus multifloccus. Folia radicalia ovato-lanceolata v. lanceolata, utrinque attenuata, sat longe petiolata, extima saepe ovata apice ± obtusa, omnia caesio-glaucula crassiuscula, antrorsum dentato-laciniata, supra glabra et saepissime intense rubro-bruneo-maculata, maculis confluentibus maximam laminae partem obsidentibus,

infra pallida villosa-hirta, saepius purpureo-violacea, margine pilis subelongatis ciliata; caulina (1—) 2—3 (—5), inferiora ± petiolata radicalibus similia (interdum subpinnatifida), superiora decrescentia sessilia, in nervo dorsali saepe parce floccosa. Inflorescentia indeterminata suprafastigiata furcato-divaricata, rami primarii 2—5 (—6) sub angulo 40° circiter abeuntes, pilis albis patentibus hirsuti, acladium 10—40 mm longum, ordines axium 3—4, capitula (2—) 5—10 (—15). Involucrum 9—10 mm longum ovatum demum subglobosum, squamae subangustae acuminatae obtusiusculae v. partim acutae, atrovirentes, viridi- v. pallide marginatae, fere effloccosae v. subfloccosae, parum pilosae v. saepissime pilis albescentibus hirtae, quibus pauci glanduliferi immixta sunt; pedunculi subcanofloccosi fere eglandulosi v. subglandulosi, subpilosi v. rarius fere epilosi. Flores intense aurei apice glabri; stylus fuliginosus; achaenia atra.

Crescit in collibus subsilvaticis et ad margines silvarum Palatinatus Bavariae pr. Wachenheim! Deidesheim! et Münster a. Stein; Prussiae Rhenanae pr. Kreuznach et Münster a. Stein!; Nassoviae pr. Wiesbaden! (leg. Dr. Touton). — Floret Maio-Jun.

Planta satis variabilis:

α) **genuinum**. Pedunculi cum involucris pilis albis patentibus ± pilosi.

1) *normale*. Folia supra eximie maculata glabra.

a) *verum*. Folia dentata.

b) *pinnatisectum*. Folia, praecipue caulina, basin versus laciniata lobis longis lanceolatis, saepe cum caulis basi minus pilosa. — Kreuznach.

β) **calviceps**. Pedunculi cum involucris fere epilosi subglandulosi v. pedunculi fere eglandulosi. Variat foliis maculatis et immaculatis. — Münster a. Stein.

Exsiccata: F. Schultz, Herb. norm. cent. I no. 96!

Tab. 19, Fig. A, B. 1—7. *H. divisum* Jord. ssp. *arenarium* Schultz-Bip. α) *genuinum*.

Hieracium vulgatum Fries, Novitiae Florae Sueciae ed. 1 p. 76 (1819), ed. 2 (1828) p. 258, Symbolae (1848) p. 115, Epicrisis (1862) p. 98; Koch Synops. ed. 2 (1844) p. 521; Grisebach, Comment. distr. Hier. gen. (1852) p. 42 pp.; Arv.-T., Hierac. Alp. franç. (1886) p. 85; Zahn in Koch Syn. (1901) p. 1783; *H. silvaticum* Lamarek, Dict. 2 (1786) p. 366, Gren. Godr., Fl. de France II (1850) p. 375.

Dispositio gregum (centroeuropaeorum):

A. Folia supra maculata.

I. *Maculatum*. Folia viridia supra distincte maculata, sat magna, ovata v. ovato-lanceolata, caulina 2—10 radicalibus similia; involucrum solum glandulosum v. pilis raris immixtis; stylus demum fuliginosus. — Huc pertinent *H. approximatum* Jord., *H. maculatum* Sm. etc.

B. Folia non maculata, rarissime inconspicue maculata.

α. Folia radicalia maiora complura silvaticiformia.

II. *Argillaceum*. Folia radicalia distincte rosulata ovata basi rotundata v. breviter contracta, caulina 4—6 radicalibus similia sed minora, omnia dilute viridia saepe sat magna; involucrum solum glandulosum; stylus luteus. — Huc pertinet *H. argillaceum* Jord. etc.

β. Folia radicalia vulgo pauca, basin versus sensim angustata utrinque attenuata caulibus ± conformia, omnia apicem caulis versus sensim v. abrupte decrescentia.

1. Involucrum pilis obscuris v. dilutis et glandulis parvis v. minutis fere aequaliter mixtis obtectum.

- III. *Acroleucum*. Involuerum gracile v. parvum ubique \pm floccosum, squamae angustae lineares, glandulis \pm densis obsitae, marginibus latiuscule floccoso-limbatae; folia laete v. pallide viridia, sparsim \pm dentata rarius ad basin \pm longe dentata, parum pilosa. — Huc pertinet *H. acroleucum* Stenstr. etc.
- IV. *Vulgatum*. Involuerum crassiusculum saepe sat magnum, minus floccosum, squamae \pm latae lanceolatae, glandulis sparsis v. densiusculis obsitae, dorso subeffloccosae, marginibus leviter v. sat dense floccoso-limbatae; folia obscure viridia, subtus vulgo \pm intense violacea, longius et magis acute parce dentata, vulgo densiuscule pilosa. — Huc pertinet *H. vulgatum* (Fr.) Dahlst.
- V. *Mertini*. Involucris squamae fere effloccosae v. solum ad basin v. etiam in marginibus sparsim floccosae, angustae aut \pm latae \pm lanceolatae, glandulis sparsis v. subnumericis et pilis sat densis (v. interdum raris) \pm obscuris apice dilutis obsitae; folia \pm gramineo-viridia saepe subglaucescentia, basalia ovato-lanceolata v. lanceolata, dentata v. inaequaliter dentata v. sat grosse et late dentata vel longe pinnato-dentata, caulina (3–) 6–12 (–20) vulgo ad basin longe 3–4 dentata vel pinnato-laciniata. — Huc pertinent *H. Mertini* Gmel., *H. pinnatifidum* Lönner., *H. sciaphilum* auct. pp., *H. macrotonum* Dahlst. etc.
2. Involuerum glandulis minutis mediocribusve et pilis obscuris v. dilutis paucis (rarioribus quam glandulae) obsitum v. vulgo solum glandulosum.
- * Involuerum multifloccum.
- VI. *Tephrofloccum*. Involucra ubique dense v. sat dense floccosa saepe microglandulosa, pedunculi albido-tomentosi; folia rigidiuscula oblongo-lanceolata saepe grosse dentata, caulina 4–7; caulis \pm crassiusculus rigidus. — Huc pertinet *H. tephrofloccum* Zahn.
- ** Involuerum modice vel parce floccosum.
- VII. *Acuminatum*. Involucra (et pedunculi) dense glandulosa saepe microglandulosa; caulis vulgo elatus crassiusculus rigidus, foliis 6–12 rigidiusculis aut \pm tenuibus lanceolatis v. late lanceo, latis acute et saepe sat longe dentatis obsitum. — Huc pertinent *H. acuminatum* Jord. *H. fastigiatum* Fr. Epicr. pp., *H. sciaphilum* auct. pp. etc.
- VIII. *Nudiceps*. Involuerum minute glandulosum, pedunculi canotomentosi eglandulosi v. glandulis rarissimis tenellis inconspicuis obsiti; caulis gracilis paucifolius; folia ovato-lanceolata v. late lanceolata tenuia acute dentata, caulina 3–5. — Huc pertinet *H. nudiceps* Čelak. etc.
- IX. *Irriguum*. Involuerum glandulis minutis mediocribusve et pilis brevibus solitariis v. paucis obsitum v. solum glandulosum, in marginibus squamarum leviter v. subdense floccosum, rarissime fere effloccosum; caulis gracilis v. crassiusculus 2–6 folius, folia ovato-lanceolata v. lanceolata \pm dentata, basalia saepe solum denticulata, caulina saepissime apicem versus \pm sanguinea. — Huc pertinet *H. irriguum* Fr. etc.
- *** Involuerum effloccosum raro marginibus parum floccosum, dense glandulosum, saepissime epilosum; folia caulina abrupte decrescentia, squamae involucris pauciseriales.
- X. *Anfractum*. Stylus obscurus; involucrum atrum nitens v. viride, glandulis brevibus \pm numericis obsitum, squamae in marginibus parce floccosae; folia glabriora. — Huc pertinet *H. anfractum* Fr. etc.
- XI. *Diaphanoides*. Stylus obscurus; involucrum atrum, glandulis elongatis numerosissimis obsitum, squamae effloccosae v. in margine tantum floccosae; folia \pm dense pilosa. — Huc pertinet *H. diaphanoides* Lindbg. etc.
- XII. *Diaphanum*. Stylus luteus; involucrum fere effloccosum, glandulis parvis crebris nigris obiectum; folia glabriora. — Huc pertinet *H. diaphanum* Fr. etc.

Grege I. Maculatum.

Subspecies **approximatum** Jordan, Catal. grains Jard. Dijon (1848) p. 20, et apud Boreau, Fl. Centre France 3 éd. (1857) p. 403, De Matrin-Donos, Florul. du Tarn (1864) p. 441, Sudre, Hierac. Centr. France (1902) p. 59; *H. maculatum* Zahn, in Koch Syn. (1901) p. 1784 (sens. lat.). — Caulis 30–80 (–100) cm altus gracilis aut crassus anguloso-striatus saepe (apicem versus) subsulcatus, inferne molliter pilosus basin versus subvillosus, superne

breviter parcepilosus multifloccus v. leviter tomentosus, usque ad basin subfloccosus. Folia subcoriacea sat magna, radicalia c. 5—7 petiolata elliptica v. ovato-lanceolata rarius lanceolata obtusiuscula v. breviter acuta, basin versus sensim attenuata in petiolum subalatum decurrentia, margine denticulata basin versus acute dentata, supra dilute viridia saepe subprasina distincte bruno- v. obscure maculata, vulgo glabra rarius parcepilosa v. in margine tantum et subtus cum petiolis breviter pilosa, in nervo dorsali subfloccosa, subtus pallidiora saepe etiam maculata; caulina 3—10 radicalibus conformia, inferiora attenuata-subpetiolata, sequentia abrupte attenuata sessilia, omnia \pm acuminata acuta sensim decrescentia, superiora subtus subfloccosa. Inflorescentia paniculata suprafastigiata pleio- v. polycephala, accladium 20—30 cm longum, rami primarii 5—10 valde remoti elongati, leviter tomentosi parcepilosi, oblique erecti, ordines axium 4; involucrum 9—11 (—12) mm longum globosum, demum late depressum, squamae dorso obscurae subangustae obtusiusculae, exteriores angustiores, interiores margine pallidae, omnes utrinque v. interiores margine tantum subfloccosae, dense et breviter sublutescenti-glandulosae fere semper epilosae, pedunculi canotomentosi, modice breviterque glandulosi fere epilosi. Flores subaurei, ligulae apice glabrae, stylus fuscus, achaenia atra.

Crescit in collibus lapidosis, ad margines silvarum et in lapidicinis regionum calidiorum Galliae centralis, Helvetiae austro-occidentalis, Germaniae mediae et australis, Tiroliae, Austriae inferioris, Moraviae, Bohemiae, Silesiae, Hungariae etc. — Floret Maio-Jul.

Variat: $\alphagenuinum. Caulis elatus, (3—) 4—7 folius, foliis dentatis ovato-lanceolatis. — Non infrequens.$

β) **naevuliferum** Jord., apud Boreau l. c. p. 404; *H. Thuringorum* Sagorski exsicc. Folia ampla, radicalia \pm ovalia breviter acuta, eximie maculata, caulina 2—3 (—5) ovata v. ovato-lanceolata, basi abrupte contracta subsessilia breviter acuminata acuta, omnia vulgo denticulata. Habitus ut in *H. diviso*. — Gallia media, Germania media et australis.

γ) **inquinatum** Jord., apud Boreau l. c. p. 404; *H. maculatum* Smith, Engl. Flora III p. 360 p. max. p. Folia radicalia ovalia v. elliptica obtusa v. acutiuscula, caulina 2—3 superiora saepe valde decrescentia, omnia vulgo denticulata; inflorescentia indeterminata. — Ad silvarum margines; Gallia centralis, Germania australis, Anglia.

Tab. 20. 1, 2. *H. vulgatum* Fr. ssp. *approximatum* Jord. (in Magniducatu Baden pr. Durlach, leg. ipse). 1. Squama. 2. Caulis portio.

Grex VII. Acuminatum.

Subspecies **acuminatum** Jordan, Catal. Grenoble (1849) p. 17, et apud Boreau, Fl. Centr. France 3 éd. (1857) p. 396 pp., Arv.-T., Hierac. Alp. franç. (1886) p. 86; *H. silvaticum* var. ? *acuminatum* Godr. Gren., Fl. France II (1850) p. 375; *H. fastigiatum* et *sciaphilum* auct. pp. — Habitus saepe *H. tridentati* Fr. Caulis 50—80 (—100) cm altus gracilis v. crassiusculus anguloso-striatus, inferne molliter pilosus basin versus subviolaceus densipilus, superne virescens parcepilosus et parcefloccosus, vulgo hypophyllopodus. Folia vulgo rigidiuscula gramineo-viridia subtus pallidiora, radicalia saepissime emarcida v. 1—2 evoluta late lanceolata caulinibus conformia, caulina numerosa, 7—12, sensim decrescentia, inferiora (saepe subconferta) saepe sat longe petiolata late lanceolata v. oblongo-lanceolata, utrinque attenuata acutiuscula v. vulgo acuta, in petiolum sensim decurrentia, media brevius petiolata, superiora basi cuneiformia, fere omnia longe acuminata acuta utrinque 4—6 dentata v. \pm

grosse serrato-dentata apicem versus integerrima, vulgo ubique breviter subpilosa v. supra glabra saepe subtus v. apicem versus subviolascens. Inflorescentia paniculata suprafastigiata pleiocephala, acladium 10—20 mm longum, rami primarii (3—) 5—10 remoti oblique erecti tenues elongati, leviter tomentosi subepilosi modice glanduliferi, ordines axium 4; involucrum 9—10 mm longum ovatum demum depressum, squamae subangustae acutiusculae, dorso obscurae ubique parce floccosae v. margine tantum dense floccosae, dense et obscure glandulosae vulgo epilosae, pedunculi canotomentosi, modice v. sat dense et obscure glandulosi vulgo epilosii. Flores dilute aurei, ligulae apice glabrae, stylus obscurus, achaenia atra.

Crescit in collibus subsilvaticis regionum calidiorum Galliae centralis, Helvetiae austro-occidentalis, Germaniae mediae et australis, Silesiae, Bohemiae, Moraviae, Tiroliae, Austriae inferioris, Hungariae etc., in alpinis usque ad 1500 m. — Floret Jul.-Aug.

Tab. 21. 1—5. *H. vulgatum* Fr. ssp. *acuminatum* Jord. (ad silvarum margines pr. pagum Dobel inter Pforzheim et Baden-Baden, leg. ipse). 1. 2. Squamae. 3. Pedunculus sub involucri. 4. Pilus stellatus. 5. Glandula.

Grex IV. *Vulgatum*.

Subspecies **lonchodes** Murr et Zahn, in Österr. bot. Zeitschr. (1902) p. 352; *H. melanops* et *rubescens* Arv.-T. in sched. herb. Murr, apud Murr in Deutsch. bot. Monatschr. (1890) p. 109 et in Allg. bot. Zeitschr. (1895) p. 232, non Arv.-T., Hierac. Alp. franç. (1886) p. 75, nec Jord.; *H. vulgat.* v. *subalpestre* Murr, Deut. bot. Monatschr. (1900) p. 53, non Norrl. — Caulis tenuis v. gracilis, 25—40 cm altus striatus molliter et breviter pilosus, basin versus subviolaceus magis pilosus, superne virescens subfloccosus et glandulis paucis tenuibus munitus, phyllopodus. Folia tenuia vulgo saturate viridia subtus paulo pallidiora, radicalia 2—4 ± longe petiolata ovato-lanceolata v. late lanceolata utrinque attenuata, rarius exteriora basi contracta, caulina radicalibus similia, 2—3 remota longe acuminata breviter petiolata v. superiora basi cuneiformia subsessilia, summum lineari-lanceolatum aut subulatum, omnia acute denticulata v. dentata mucronulata, vulgo utrinque pilis mollibus brevibusque subpilosa petiolo magis piloso, saepe subviolascens. Inflorescentia laxa paniculata saepius ± altefurcata, oligocephala, acladium 25—35 (—60) mm longum, rami primarii 2—4, infimi valde remoti v. saepe non evoluti, oblique erecti tenues elongati, leviter tomentosi breviter pilosi et tenuiter subglandulosi, ordines axium 3, capitula 2—5 (—10); involucrum 10—11 mm longum ovato-cylindricum demum ovatum basi rotundatum, squamae subangustae acuminatae acutiusculae, dorso obscure virides effloccosae solum in margine parciflocae, omnino pilis modice numerosis brevibus apice dilutis et glandulis tenuibus rarioribus v. pariter numerosis immixtis vestitae, exteriores angustiores et breviores, interiores margine e viridi pallentes, pedunculi leviter cani breviter pilosi et tenuiter glandulosi. Flores dilute aurei, ligulae apice glabrae, stylus fuscus, achaenia atra.

Crescit locis silvaticis et humidiusculis subalpinis et alpinis Tiroliae: Pitztal (leg. Evers), Innsbruck (leg. Murr), Paznauntal (leg. ipse); Vorarlbergiae: in jugo m. Arlberg (leg. Murr). — Flor. Jul. Aug.

Tab. 22, Fig. A, B. 1—8. *H. vulgatum* Fr. ssp. *lonchodes* M. et Z. A. Planta (e jugo Waldrast p. Innsbruck). B. Inflorescentia plantae e valle Pitztal. 1—4. Squamae. 5. Caulis portio. 6. Dentes ligulae. 7. Achaenium. 8. Portio limbi folii.

Species intermediae:

20. Hieracium Prediliense Naeg.-Pet., Hierac. Mittel-Europas II (1886) p. 60 (sub nomine *H. illyricum* ssp. *prediliense*); *H. Prediliense* Zahn, in Koch Synops. (1901) p. 1787 = **silvaticum-porrifolium** Naeg.-Pet. l. c. p. 61, Zahn l. c.

Subspecies **Prediliense** N. P., Zahn l. c. — Caulis ad 40 cm altus gracilis, apicem versus ramosus, phyllopodus, inferne subdense et molliter albopilosus, superne parcepilosus, fere usque ad basin deminute floccosus, eglandulosus. Folia rosularia pauca, ± petiolata, lanceolata, remote denticulata, acuta, rigidiuscula, ± glaucescentia, supra glabra, in margine et subtus subpilosa v. in nervo mediano subvillosa; caulina 5—8, sursum sensim decrescentia et minus pilosa, inferiora subpetiolata, superiora sessilia linearia integerrima, in nervo dorsali subfloccosa. Inflorescentia laxa paniculata oligocephala, acladium 10—20 mm longum, rami primarii 3—6 subconferti, tenues haud turbinati, ordines axium 2—3; involucrum 8—9 mm longum ovatum, squamae sublatiusculae acutiusculae, obscurae parum dilute marginatae, breviter parcepilosae v. subepilosae, disperse glandulosae, sat dense floccosae margine tomentosae, pedunculi leviter tomentosi fere eglandulosi epilosi. Flores saturate lutei, ligulae apice glabrae, stylus subluteus v. fuscescens, achaenia atra.

Crescit in jugo Predilpass!, Carinthiae (leg. R. de Benz). — Flor. Jul.-Aug.

Tab. 23. 1—7. *H. Prediliense* N. P. ssp. *Prediliense* N. P. 1, 2. Squamae. 3, 4. Caulis portiones. 5. Margo ligularum. 6. Folii caulini portio: pars aversa. 7. Marginis folii portio.

21. Hieracium Fluminense A. Kerner, Österr. bot. Zeitschr. (1874) p. 171, N. P., Hierac. Mittel-Europ. II (1886) p. 29 emend. in nota = **silvaticum-glaucum**; *H. caesium* ssp. *Fluminense* Zahn, in Koch Syn. (1901) p. 1790. — Caulis 15—25 cm altus gracilis, superne subtomentosus inferne usque ad basin subfloccosus, alte furcatus. Folia viridia ± glaucescentia rarissime submaculata, rosularia complura, exteriora minora, obovata v. oblonga spathulata ± silvaticiformia, intima oblongo-lanceolata lanceolatave, abrupte v. sensim in petiolum angustata petiolata, acute denticulata v. praecipue basin versus ± grosse dentata, apicem versus abrupte v. sensim acuminata acuta, margine subpilosa v. fere epilosa, in nervo mediano petioloque breviter ciliata, subtus modice v. sat dense floccosa; caulinum 0—1, anguste lanceolatum v. lineare, elongatum. Inflorescentia (1—) 2—5 (—7) cephalata, acladium (10—) 25—40 mm longum, rami primarii 2—3 (—4) inferiores remoti, ordines axium 2—3; involucrum ovatum, squamae obscure canae, dilute marginatae, sublatiusculae acuminatae obtusiusculae v. intimae acutae, canofloccosae, disperse pilosae, fere eglandulosae; pedunculi canotomentosi epilosi eglandulosi. Flores saturate lutei, ligulae apice glabrae, stylus fuscus, achaenia atra.

Crescit locis petrosis calcareis pr. Fiume (ad viam „Luisenstrasse“ non procul a Porta Hungarica loc. class. Kernerianus, et a „Banska vrata“ ad viam Žakaljšenskem, in saxosis vallis Recina, leg. Pichler); insula Veglia (Dre Catti); in fagetis m. Laginac supra Ostarje, Dalmatiae (leg. Pichler, sub nom. *H. canescens*), et in rupibus pr. Conisco non procul a Sign (leg. Pichler, sub nom. *H. lasiophyllum*). — Flor. iam Maio, Jun.

Exsiccata: Flora exsicc. Austro-Hungarica no. 3351! (Fiume).

Tab. 24. 1—8. *H. Fluminense* A. Kern. (e loc. class., leg. Hirc). 1, 2. Squamae. 3. Caulis portio. 4. Ligularum margo. 5. Folium caulinum: portio e parte aversa. 6. Pars aversa folii rosularis. 7. Achaenium. 8. Marginis folii portio.

22. Hieracium Ganderi Hausmann, apud Huter in Osterr. botan. Zeitschrift (1870) p. 338 et in sched.; Nyman, Conspectus Fl. Europaeae II (1879) p. 443 sub *H. fasciculare* Fr. [non *H. Ganderi* Huter olim et in herb. Schultz-Bip., nec Nyman l. c. p. 440 sub *H. cydoniaefolium* = *ochroleucum* Schl.]; Zahn, in Koch Synops. (ed. Hallier-Wohlfahrt, 1901) p. 1788 sub *H. Mureti* = **silvaticum** < **glaucum** (v. *bifidum-glaucum*) Zahn l. c.

Subspecies **Mureti** Gremli, Neue Beiträge z. Flora d. Schweiz III (1883) p. 17 et in Exkursionsfl. d. Schweiz, ed. 5 (1885); Zahn l. c.; *H. politum* Christener, Hieracien d. Schweiz (1863) p. 13; Gren. Godron, Fl. de France II (1850) p. 355 pp., apud Grenier in litt. ad Christener; nec Grisebach, Comment. (1852) p. 73, nec Fries, Symb. (1848) p. 84, Epicrisis (1862) p. 73. — Caulis 15—30 cm altus gracilis oblique erectus saepe subflexuosus, supra medium vel usque ad basin squarroso-ramosus, phyllopodus, epilosus, eglandulosus, usque ad basin ± floccosus; rhizoma crassiusculum, saepe pluricaule. Folia rosularia numerosissima, in petiolum brevem saepe brevissimum sensim attenuata, exteriora breviora oblongo-lanceolata acutiuscula, interiora ± longiora lanceolata v. anguste lanceolata acuta, denticulata v. breviter serrato-dentata v. praecipue basin versus interdum ± grosse dentata, raro subintegerrima, utrinque epilosa v. subtus praecipue in nervo mediano ut in margine petioloque sparsim et breviter pilosa saepe in petioli basi pilis paulo numerosioribus obsita; omnia saturate viridia glaucescentia, supra interdum submaculata, subtus saepe subfloccosa v. dense floccosa, saepissime ± crassiuscula, interdum sat parva; caulina saepissime bracteiformia linearia v. subulata, rarius unum evolutum, profunde insertum, radicalibus simile. Inflorescentia ± indeterminata, rami primarii 1—2 (—3) valde remoti, arcuato-erecti, graciles, 2—3 cephalii, acladium $\frac{1}{5}$ — $\frac{1}{2}$ totius caulis exhibens, capitula 3—10; involucrium 10 mm longum, ovatum, primo saepe subturbinatum, postea basi truncatum; squamae angustae, obtusiusculae, obscurae, multiflocae v. subcanotomentosae, omnino epilossae et eglandulosae rarius pilis brevibus solitariis obsitae; bractee subnumerosae, sub involucrio saepe subconfertae; pedunculi apicem versus subincrassati, canotomentosi, epilosi, eglandulosi. Flores saturate lutei, ligulae apice glabrae, stylus obscurus, achaenia atra.

Crescit locis sabulosis calcareis in alpinis Helvetiae orientalis inter 1300—2000 m: Lenzer Heide pr. Chur (loc. class., Muret, Christener), inter Lenz et Chur (Muret), Arosa (Brügger), Schiatobel pr. Davos (v. Tavel), Bergün, Costainas (Muret), Ofenpass (Brunies), Piz Alv (Schröter), Piz Padella (Kraetli), Val Fraele (Heer), in jugo Splügen versus Italiam (Christener), Campo (R. Keller), Mte Salvatore (Muret); Italiae: supra Bormio (Brügger); Tiroliae: in monte Braulio (Brügg.), Nauders (Tappeiner), in alpinis Hochalpen pr. Meran (Bamberger), in valle Groedenertal (Huter), pr. Schludersbach, Landro (Hegelmaier), Val Zelline (Huter), Lienz (Gander); Carinthiae: Villach (Preissmann), Seiseralp (Jabornegg); Stiriae superioris: in alp. petrosis „in der Fölz“ pr. Aflenz (Zahlbruckner, de Benz). — Flor. Jul.-Aug.

In Helvetia orientali saepissime in consortio *H. glauci* All. ssp. *Willdenowii* Monn.

Tab. 25, Fig. A. 1—4. *H. Ganderi* Hausmann ssp. *Mureti* Gremli (e loco classico: Lenzer Heide, leg. ipse). 1. Squama. 2. Pedunculus sub involucrio. 3. Dentes ligularum. 4. Achaenium.

Subspecies **Ganderi** Hausm., apud Huter l. supra cit.; *H. canescens* v. *Ganderi* Huter, Österr. bot. Zeitschr. l. c. et in sched. — Caulis ad 35 cm altus gracilis v. tenuis erectus subflexuosus, epilosus, eglandulosus, supra medium ± floccosus, furcato-ramosus, phyllopodus.

Folia rosularia numerosa, exteriora minora obovata v. elliptica, obtusiuscula, sequentia lanceolata v. anguste lanceolata, omnia abrupte v. sensim in petiolum saepe sat longum attenuata acuta, acute serrato-dentata, multidentata, glauca, supra pilosa, in margine et in nervo dorsali disperse pilosa, in petiolo pilis brevibus numerosioribus obsita, interdum fere omnino glabra; caulina 1—2 (—3) lineari-lanceolata v. linearia, sparsim denticulata v. integerrima, saepe elongata acuminata. Inflorescentia \pm indeterminata (1—) 2—9 cephalata, acladium 2—8 (—12) cm, rami primarii 1—4 suboblique erecti (inferiores saepe non evoluti), simpliciter ramosi 1—3 cephalati; involucrum 10 mm longum gracile ovatum, primo \pm turbinatum; squamae angustae acutiusculae, dilute marginatae, multifloecae v. canotomentosae, pilis sparsis brevibus obscuris obsitae; pedunculi leviter cani, subepilosi eglandulosi, rarius glandulis solitariis praediti; bracteae 3—5 rarius plures, superiores sub involucrio confertae. Flores saturate lutei, ligulae apice glabrae, stylus demum obscurus, achaenia atra.

Crescit locis sabulosis calcareis Tiroliae: Niederndorf, Landro, Bad Prags (Gander), inter Brücke et Plätzwiesen (Murr), Schludersbach, Ampezzo, Fischleintal pr. Sexten (Huter), Kerschbaumer Alpe (Pichler); Carinthiae: Wildensentälpe in valle Gailtal, Römertal pr. Tarvis (de Benz); Stiriae: Foelzalpe in monte Hochschwab, Okreslhütte in alpib. Steiner-alpen (de Benz); Austriae inferioris: ad flumen Ybbs pr. Rosenau (de Handel-Mazetti); Helvetiae engadinensis: Samaden, Val Chamuera (Kraetli). — Flor. Jul.-Aug.

Exsiccata: Fl. exsicc. Austro-Hung. no. 3352 pp. (sub nomine *H. canescens*, e valle Sextental, leg. Ausserdorfer; partim *H. glaucum* All. ssp. *Isaricum* N. P.); Fl. exs. P. — (*H. canescens* v. *Ganderi* Fl. exs. Austro-Hung. no. 3352 I, in declivitatibus rupestribus pr. W.-Matrei, leg. Ausserdorfer, est *H. glaucum* All. ssp. *tephrolepium* N. P. α) *genitum* 5) *latiusculum* N. P. II p. 33). — Fries, Hierac. Europ. no. 42.

Tab. 25, Fig. B. 5—6. *H. Ganderi* Hausm. ssp. *Ganderi* Hausm. (pr. Landro, leg. Murr). 5. Squama. 6. Pedunculus sub involucrio.

23. Hieracium subcanescens Murr, Allgem. bot. Zeitschr. (1899) p. 61; Österr. bot. Zeitschr. (1902) p. 353; H. inclinatum A.-T. in sched. herb. Murr, apud Murr, in Deut. bot. Monatsschr. (1897) p. 224; nec Hier. Alp. franc. (1886) p. 21; H. Mureti ssp. subcanescens Zahn, in Koch Syn. (ed. Hall.-Wohlf., 1901) p. 1788 = *incisum* < *glaucum*. — Caulis 20—30 cm altus subtenuis, rhizoma interdum pleioscapum. Folia rosularia satis numerosa breviter (rarius longius) petiolata, exteriora minora ovata, obovata v. elliptica, sequentia ovato-lanceolata, oblongo-lanceolata v. lanceolata, breviter vel longe acuminata acutiuscula v. acuta, basi truncata v. rotundata v. \pm sensim in petiolum attenuata, denticulata v. infra medium v. basi tantum dentibus patentibus \pm grosse dentata, omnia saturate viridia glaucescentia rigidiuscula, supra pilosa, subtus interdum \pm disperse floccosa; caulina 0—2 cito decrescentia remota, inferius lanceolatum breviter petiolatum subdentatum v. ut summum anguste lanceolatum v. lineare, \pm integerrimum. Inflorescentia furcata, \pm indeterminata, (1—) 2- oligocephala, acladium 25—50 mm (— $\frac{1}{3}$ totius caulis), rami primarii 1—2 remoti subarcuato-erecti, monocephali v. simpliciter ramosi 2 (—3) cephalati; involucrum 10—12 mm longum ovatum; squamae sublatiusculae obtusiusculae obscurae v. subnigrae, parum (praecipue interiores) dilute marginatae, modice floccosae v. multifloecae, disperse v. submediocriter breviterque pilosae, pilis obscuris v. basi atris apicem versus dilutioribus, glandulis nullis v. sparsis obsitae; bracteae 3—5;

pedunculi superne multiflocci, inferne subeffloccosi v. nudi, parcepilosi, eglandulosi v. subglandulosi. Flores saturate lutei, ligulae apice glabrae, stylus obscurus, achaenia atra.

Subspecies **pseudisaricum** Murr l. c.; *H. Mureti* 3) *subcanescens* α) *pseudisaricum* Zahn, in Koch Synops. l. c. p. 1789; *H. rupicolum* Evers, in Beiträge z. Flora des Trentino (1896) p. 33. — Habitus ± ut *H. glauci* All. Caulis fere epilosus v. tantum basin versus parcepilosus. Folia in nervo dorsali pilis raris adspersa, in margine epilosa v. basin versus pilis raris subciliata, in petiolo subpilosa, subtus ± floccosa; caulina subtus floccosa, in nervo dorsali tantum pilis solitariis obsita. Squamae sparsim et obscure pilosae subdense floccosae eglandulosae; pedunculi superne parcepilosi eglandulosi (rarissime squamae et pedunculi glandulis solitariis praedita).

Crescit in alpinis calcareis Tiroliae: pr. Innsbruck (Höttinger Alpe, Issanger in monte Salzburg); in monte Ortler ad pedem glaciei Madatschferner (Evers); Bavariae: in glareosis Dammkar p. Mittenwald, Wettersteinalpe, detex. et leg. J. Murr; Carinthiae: Wildensenter-alpe, pr. Thörleralpe (de Benz); Stiriae: Okrešlhütte in alpinis Steiner Alpen (idem). — Flor. Jul.-Aug.

Tab. 26, Fig. A. 1—4. *H. subcanescens* Murr ssp. *pseudisaricum* Murr (e monte Höttingeralpe, leg. J. Murr). 1. Squama. 2. Pedunculus sub involucro. 3. Margo ligularum. 4. Folium caulinum: portio e parte aversa.

Subspecies **incisiforme** Murr l. c.; *H. Mureti* 3) *subcanescens* β) *incisiforme* Zahn l. c. p. 1789. — Caulis breviter parcepilosus, saepe minus elatus submonocephalus. Folia margine subtusque et praecipue in petiolo pilis brevibus subnumeris obsita, magis dentata quam in priore subspecie, subtus effloccosa. Squamae modice et breviter pilosae, sparsim glandulosae subfloccosae, subobtusae; pedunculi subpilosi subglandulosi, inferne eglandulosi. Habitus ut in *H. senili* A. Kerner, sed differt squamis subobtusis etc.

Crescit in glareosis calcareis alpium Tiroliae: Haller Anger pr. Innsbruck (detex. et leg. J. Murr); Helvetiae Engadinensis: Val Chamuera pr. Ponte (leg. Leresche). — Flor. Jul.-Aug.

Tab. 26, Fig. B. 5—7. *H. subcanescens* Murr ssp. *incisiforme* Murr (e loco classico Haller Anger, leg. J. Murr).

24. Hieracium bifidum Kit., in Hornemann, Hort. Hafniensis II p. 761 et Add. p. 115 (1815); Froel., in DC., Prodr. VII (1838) p. 214; Fries, Epicris (1862) p. 93; Zahn, in Koch Syn. (ed. Hall.-Wohlf.) p. 1791 (1901), non Koch, Synops. ed. 2 (1844) p. 523; huc refero *H. subcaesium* Fries, Epicrisis p. 92, G. de Beck, Fl. v. Niederösterreich. (1893) p. 1298, Zahn l. c. p. 1792, et etiam *H. silvaticum* H. Dahlstedt, Bidrag till Sydöstra Sveriges Hierac.-Flora (in Kongl. Svensk. Vet.-Akad. (1852) p. 58; Reichb., Composit. tab. 190 f. 1 (1860), non Fr.; *H. incisum* Koch, Syn. ed. 2 (1844) p. 523 pp.; *H. murorum* v. *incisum* Fr., Symb. p. 110; *H. murorum* v. *subcaesium* Arv.-T., Hierac. Alp. franç. (1888) p. 83; *H. murorum* v. *alpestre* Christener, Hierac. d. Schweiz (1863) p. 15; = **silvaticum** > **glaucum**.

Subspecies **pseudodollineri** Murr et Zahn, in Koch, Synops. (ed. Hall.-Wohlf., 1901) p. 1819. — Caulis ad 50 cm altus crassiusculus, striatus, basin versus parcepilosus, superne multifloccus, squarrosus-ramosus. Folia rosularia compluria (—10), ± longe petiolata, exteriora obovata v. ovato-lanceolata v. lanceolata rhombiformia, obtusa v. acutiuscula, basi rotundata

v. saepius in petiolum angustata cuneata, rarius truncata, interiora elliptico-lanceolata v. oblongo lanceolata v. lanceolata, in petiolum sensim attenuata, breviter acuta v. \pm longe acuminata, serrato- (saepe grosse-) dentata, basin versus profundius v. subinciso-dentata v. (interiora) sublaciniata dentibus numerosis patentibus, utrinque breviter subpilosa, supra saepius fere epilosa v. sparsim pilosa, subtus molliter subpilosa, in margine et subtus in nervo mediano densius pilosa, in petiolo pilis suberispis albidis subvillosa, omnia obscure glauco-viridia, subtus sordide subglaucescentia, firma, saepius basin versus cum petiolis et caulis basi subcolorata; caulinum petiolatum lanceolatum paucidentatum, saepe grosse pinnato-dentatum (interdum 2 evoluta, summum lineare v. subulatum), subtus saepissime subfloccosum v. etiam radicalia in nervo mediano parcifloca. Inflorescentia laxa paniculata v. altefurcata, \pm indeterminata, 3—7 (—10) cephalia, parum suprafastigiata; accladium 1—5 (—8) cm longum, rami primarii (2—) 3—4 (—5) remoti v. valde remoti, subarcuato-erecti elongati, simpliciter ramosi 1—3 cephalia, graciles (interdum unus alterque caulis secundarius evolutus); involucrum cylindrico-ovatum demum ovatum, 11—12 mm longum; squamae subangustae obtusiusculae v. acutiusculae, interiores saepe acutae, modice pilosae subglandulosae, dense floccosae subcinereae; bractae 2—4 subulatae; pedunculi canotomentosi, superne parcepilosi, saepissime eglandulosi. Flores saturate lutei, ligulae apice glabrae, stylus obscurus, achenia atra. — Inter *H. Dollineri* Sch.-Bip. et *H. bifidum* typicum quasi intermedium.

Crescit locis glareosis calcareis Tiroliae australis in consortio *H. Dollineri* ssp. *Tridentini* Evers: multis locis circa Trient (Val de Lievre s. n. *H. bifidum* et incisum, Murr), Lavini di Marco pr. Mori (Murr). Flor. Jun.-Jul.

Variat: α) **eriopodoides** Zahn, in Koch Syn. l. c. p. 1819. Folia latiora, saepe subcoriacea, involucrum crassiusculum plus 10 mm longum, dense floccosum subcinereum. Huc pertinet planta austro-tirolensis et icon. nostr.

β) **pseudodollineri** M. et Z. l. c. Folia laeteviridia subglaucescentia basi latiora subtruncata saepe subcordata, tenuiora, involucrum minus quam in α , squamae angustiores acutiores canovirides. — Austria sup. et inf.: Windischgarsten (Dürrnberger), Kreuzberg pr. Weyer, Kastenreith, Salzatal (idem); Bavaria: München; Idria in Carnia (Dolliner).

Exsiccata: Dörfler, Herb. norm. no. 4352 (var. α).

Tab. 27. 1—7. *H. bifidum* Kit. ssp. *pseudodollineri* M. et Z. α) *eriopodoides* Zahn (ad torrentem Fersina pr. Trient, leg. J. Murr). 1, 2. Squamae. 3. Pedunculus sub involuero. 4. Dentes ligularum. 5. Pilus stellatus. 6. Achaenium. 7. Folium caulinum: portio e parte aversa.

Subspecies **chartaceum** Čelakovsky, in Sitz.-Berichte böhm. Gesellsch. d. Wissenschaft. (1887) p. 630; Oborny, Fl. v. Mähren I (1885) p. 593; Zahn, in Koch Syn. (1901) p. 1791. — Caulis ad 50 cm altus crassiusculus, basin versus parcepilosus, superne multifloccus, squarroso-ramosus. Folia rosularia mediocriter v. longe petiolata, late ovata, subcordata v. truncata, obtusa cum mucrone v. intima \pm acuminata acutiuscula v. acuta, basi truncata v. pleraque in petiolum \pm decurrentia, leviter et remote subsinuato-dentata (dentibus acutis v. mucronatis), basin versus dentibus elongatis patentibus acutis praedita v. saepe inciso-dentata dentibus in petiolum descendentibus, supra epilosa, margine subtusque disperse breviter pilosa, in nervo dorsali petioloque pilis mollibus mediocriter pilosa v. subvillosa, omnia laete viridia subglaucescentia subtus sordide viridia, rigidiuscula; caulina 0—1 (—2) petiolata lanceolata

v. linearia. Inflorescentia altefurcata (2—) 3—5 (—7) cephalae; acladium (1—) 2—5 (—8) cm, rami primarii 1—2 (—3) remoti elongati simpliciter v. repetito-ramosi 1—3 cephalae, ordines axium 2—4; involucrium c. 12 mm longum ovatum basi rotundatum crassiusculum; squamae subangustae, sat longe acuminatae acutiusculae v. intimae acutae, breviter subpilosae, subdense floccosae et modice glandulosae; pedunculi multiflocci v. subcanotomentosi sparsim pilosi, modice et minute glandulosi. Flores saturate lutei, ligulae apice glabrae, stylus luteus, demum interdum fuscescens, achaenia atra.

Crescit in declivibus vallis Granitzatal et Thayatal ad oppidum Znaim, Moraviae (A. Oborny). — Flor. Jun.-Jul.

Tab. 28. *H. bifidum* Kit. ssp. *chartaceum* Čelak. (e valle Granitzatal, leg. Oborny). 1. Squama. 2. Pedunculus sub involucrio. 3. Dentes ligularum. 4. Achaenium. 5. Pilus stellatus. 6.

25. Hieracium Wiesbaurianum Uechtritz, in Baenitz, Herb. europ. (1879) prospectus p. 5 = **bifidum-Schmidtii**.

Subspecies **Wiesbaurianum** Uechtritz l. c. p. 5 et exsicc. no. 3679; Deutsch. bot. Monatsschr. (1884) p. 102; Zahn, in Koch Syn. (1901) p. 1801; *H. bifidum* var. *cinerascens* Arv.-Touv., Hierac. Alp. franç. (1888) p. 80; *H. incisum-Schmidtii* Zahn l. c. — Caulis 20—50 cm altus gracilis v. crassiusculus subtiliter striatus, sparsim breviter pilosus et parce floccosus, subflexuosus. Folia rosularia exteriora elliptica obtusiuscula ± longe petiolata, sequentia ± oblonga basi truncata v. breviter angustata acutiuscula v. acuta, a medio ad basin ± profunde et grosse sinuato-dentata pinnatifidaque dentibus ± obtusis mucronatis, interiora lanceolata utrimque attenuata acuta parcius dentata; omnia rigidiuscula supra subglaucescentia sordide viridia subdense breviter setaceo- et curvato-pilosa, subtus dilute viridia glaucescentia subdense et submolliter pilosa (petiolus breviter subvillosus) et ± floccosa v. in nervo dorsali tantum subfloccosa; caulinum 0—1 radicalibus simile v. anguste lanceolatum acutum. Inflorescentia altefurcata v. laxè paniculata (1—) 3—10 (—17) cephalae paulum suprafastigiata; acladium 2—5 (—8) cm longum, rami primarii (0—) 2—4 (—6) remoti, ordines axium 2—3 (—4). Involucrium 10—12 mm longum ovatum; squamae angustae acuminatae acutae subcanotomentosae, glandulis parvis sparsis et pilis apice dilutis basi obscuris breviter subpilosae; pedunculi canotomentosi subpilosi, sparsim tenuiterque glandulosi; bracteae 2—4 parvae. Flores lutei, ligulae apice subciliatae, stylus luteus, achaenia subatra.

Crescit in montosis calcareis, pp. in pinetis Austriae inferioris pr. Vindobonam, ut in monte Calvarienberg pr. Gumpoldskirchen (Wiesbaur), p. Moedling (Sonklar) et Kalksburg (Wiesbaur); Moravia: Eisleithen pr. Fraun (Pospichal); Hungariae: ad montem Badacsony versus Tomay non procul ab Lacu Balatonensi (v. Borbás)!

Variat: 1) *angustifolium* Wiesbaur, in Deutsch. bot. Monatsschr. (1884) p. 103. Folia angustiora in petiolum attenuata. — Gumpoldskirchen.

2) *subditum* G. de Beck, Fl. v. Niederösterreich. (1893) p. 1292. Folia supra multo minus pilosa glabrescentia, pedunculi subdense glandulosi. — Gumpoldskirchen; Gallia: Delphinatus: Sassenage (Neyra).

Exsiccata: Baenitz, Herb. Europ. no. 3679 (planta Wiesbauriana!); Société franco-helvétique, no. 758 (sub nomine *H. murorum* v. pilosissimum, pr. Sassenage leg. Neyra).

Tab. 29, Fig. A. 1—3. *H. Wiesbaurianum* Uechtr. ssp. *Wiesbaurianum* Uechtr. (e loco class. Gumpoldskirchen, leg. Wiesbaur). 1. Squama. 2. Pedunculus sub involucrio. 3. Achaenium.

Subspecies **diversifolium** Čelakovsky, in Resultate d. bot. Durchforsch. Böhm. (1886) p. 190; Zahn, in Koch Syn. (ed Hall.-Wohlf.) p. 1777 (1901) sub *H. Schmidtii* grex b) *Rupicolum*. — Planta inter *H. bifidum* Kit. et *H. Schmidtii* Tausch quasi intermedia. Caulis ad 40 cm altus gracilis v. crassiusculus saepe subflexuosus striatus, phyllopodus, breviter subpilosus v. rariopilus, superne multifloccus et parce glandulosus. Folia rosularia exteriora ovata v. elliptica obtusa minora, basi truncata v. saepe subcordata, sed semper in petiolum \pm breviter decurrentia, sequentia elliptica v. oblongo-lanceolata obtusiuscula mucronata v. acutiuscula, basi truncata v. rotundata, lamina in petiolum contracta subdecurrente, interiora in petiolum brevius longiusve attenuata longe acuminata acuta; caulinum breviter petiolatum lanceolatum longe acuminatum acutum; omnia rigidiuscula glaucescentia subtus pallide viridia glaucescentia, denticulata v. basin versus magis dentata, supra glabra marginem versus et in margine ipso setaceo-pilosa ciliata, subtus in nervo mediano petioloque modice pilosa et saepissime (praecipue interiora) parce floccosa. Inflorescentia laxa paniculata v. altefurcata subindeterminata 3—10 cephalis; acladium 2—5 cm longum; rami primarii 2—4 remoti oblique erecti simpliciter v. repetito-furcati. Involucrum 11—13 mm longum ovato-cylindricum; squamae angustae longe acuminatae acutissimae flores novellos duplo minores quasi tubo aperto coronant, obscurae subdilate marginatae, breviter subpilosae subdense floccosae et modice glandulosae, pedunculi subcanotomentosi, subglandulosi, breviter subpilosi, pili apice diluti basi obscuri; bractae 2—4 parvae. Flores lutei, ligulae apice rarius subciliatae, stylus luteus, achaenia atra.

Crescit locis silicaceis vulcanicis Bohemiae, ut in monte Ziegenberg pr. Aussig (l. class.), pr. Vorlik ad fl. Moldau (leg. Domin).

Grex I. Villosiforme N. P. II p. 175.

Subspecies **villosiforme** N. P.; *H. villosum* c. *grossidens* Fries, Epicr. (1862) p. 64. — Caulis ad 50 cm altus crassus subflexuosus eximie striatus erectus phyllopodus, furcato-

ramosus, 3—7 cephalus, pilis numerosis dilutis 3—5 mm longis vestitus, eglandulosus, superne ± albotomentosus, inferne usque infra medium deminute floccosus. Folia utrinque pilosa (2,5—3,5 mm), rosularia pauca v. compluria petiolata, oblonga, in petiolum longe attenuata, obtusa v. acuta mucronata, irregulariter grosse serratodentata, dentibus antrorsum arcuatis breviter et argute acuminatis praedita; caulina 6—10, sat magna, sensim decrescentia in bracteas deminuta, infima oblonga basin versus attenuata subpetiolata, sequentia attenuata sessilia, summa fere elliptica v. basi ovata acuta; omnia glaucescentia mollia radicalibus similia saepissime in margine subundulata. Inflorescentia furcata indeterminata acladium 1,5—7 cm longum; rami primarii 2—6 crassiusculi remoti oblique erecti monocephali. Involucrum 14—15 mm longum globosum demum ventricosum; squamae latae lanceolatae, ± acuminatae acutissimae obscurae, exteriores laxae; bracteae c. 5 foliaceae. Pili in involucrio numerosi diluti, 3 mm longi, glandulae apicem squamarum versus modice numerosae minutissimae, flocci involucri basin versus ± numerosi apicem versus subnulli. Flores dilute flavi, dentes ligularum saepe subciliati, stylus luteus fuscescens, achaenia rubrobrunea, 4—4,5 mm longa.

Crescit in alpinis calcareis inter 1900—2100 m; Helvetia: Binntal (Besse); Tirolia: Kaserenwiesen pr. Neuprags (Naegeli), Vennertal in jugo Brenner (idem); Carinthia: in pratis Albitzenwiesen iuxta glaciem Pasterze (idem). — Flor. Jul.-Aug.

Tab. 31, Fig. A. 1—2. *H. dentatum* Hoppe ssp. *villosiforme* N. P. (Binntal, leg. ipse). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies **aechmetes** N. P., Hierac. Mitteleurop. II (1886) p. 176. — Caulis ad 30 cm altus gracilis erectus subflexuosus striatus phyllopodus dense et longe (5—8 mm) pilosus, superne tomentosus, inferne usque ad basin sat multifloccosus. Folia rosularia 2—5 (interdum compluria) non petiolata, rarius subpetiolata, oblonga ± obtusa v. acutiuscula mucronata, denticulata v. sparsim grosse dentata; caulina 3—4 sensim decrescentia basi rotundata sessilia, summa late ovata, ± acuta subamplexicaulia; omnia subglaucescentia rigidiuscula subdense pilosa (2—4 mm), summa subtus in nervo mediano interdum parce floccosa. Inflorescentia altefurcata indeterminata 1—3 cephalata; acladium 2—5 (—11) cm longum; rami primarii 0—2 valde remoti graciles monocephali. Involucrum 14—16 mm longum ovatum demum globosum; squamae latiusculae longe acuminatae acutissimae nigrae, extimae laxae, dense et dilute pilosae (2—3,5 mm), apicem versus minutissime glandulosae, effloccosae; bracteae 4—5, infimae lanceolatae foliaceae, summae lineares. Flores lutei, ligulae apice subglabrae, stylus luteus, achaenia dilute brunea, 3—4 mm longa.

Crescit in alpinis calcareis inter 1800—1900 m; Helvetia: Berner Alpen (N. P.), Parpan versus Weisshorn (Peter), Sertigtal p. Davos, leg. ipse; Tirolia: Wolfenalp in jugo Brenner (Naegeli), Fleimstal (N. P.); Carinthia: Pasterze (Naegeli). — Plantae minus longe pilosae: Pasterze, Neuprags (Naegeli), Albula, Curfirsten supra Quinten, Rochers de Naye supra Montreux (idem). — Flor. Jul.-Aug.

Tab. 31, Fig. B. 3—4. *H. dentatum* Hoppe ssp. *aechmetes* N. P. (Sertigtal). 3. Squama. 4. Pedunculus sub involucrio.

Crex II. Subvillosum N. P., Hierac. Mitteleurop. II p. 179 (1886).

Subspecies **subvillosum** N. P. l. c. p. 181. — Caulis ad 35 (—48) cm altus subascendens gracilis ± flexuosus striatus, phyllopodus, sat dense et dilute pilosus (3—4 mm), eglandulosus, superne canotomentosus, inferne usque ad basin deminute floccosus. Folia

rosularia 2—5 breviter longiusve petiolata, saepe tantum attenuata et subundulata, exteriora oblonga obtusa minora, interiora \pm lanceolata acutiora v. acuta maiora, denticulata v. fere integerrima v. sparsim longius dentata; caulina 3—4 sensim decrescentia \pm lanceolata v. oblonga sessilia basi subattenuata v. rotundata; omnia dilute viridia subglaucescentia utrinque subdense molliterque pilosa (3—4 mm) effloccosa. Inflorescentia altefurcata indeterminata 1—3 cephalia; acladium 3—7 cm longum; rami primarii (0—) 1—2 remoti graciles monocephali. Involucrum 13—15 mm longum globosum; squamae subangustae lineares, longe acuminatae acutissimae, nigrae, extimae laxae, dense et dilute pilosae (2—3 mm), apicem versus disperse glandulosae, effloccosae; bracteae 2—4 lineares. Flores lutei, ligulae apice glabrae v. breviter sparsimque ciliatae, stylus luteus v. obscurus, achaenia nigrobrunea v. dilute brunea, 3,6—4 mm longa.

Crescit in calcareis alpinis inter 1400—2400 m: Jura, Helvetia, Vorarlbergia, Tirolia, Bavaria australis, Carinthia. — Flor. Jul.-Aug.

Planta maxime mutabilis. Variat:

α) **genuinum** N. P. l. c. p. 182.

1) *normale* N. P. — Helvetia: Ad pedem m. Wetterhorn (Christener), in Ormonts, Catogne, Les Verreaux supra Vevey (Naegeli), Jura: Weissenstein, Reculet (Muret), Splügen, Albula, Val Avers, Val Tuors, Val Fex, St. Moritz, Val Lischana pr. Schuls, Lukmanier (Naegeli etc.).

2) *undulatum* M. Z. Planta valida, foliis subintegris distincte undulatis laete viridibus; e commixtione formae cuiusdam elongatiformis *H. villosi* ortum ideoque *H. Trefferiano* subsimile. — In monte Platzerberg pr. Gossensass, Tiroliae (leg. J. Murr).

3) *calvius* N. P. l. c. Folia distincte petiolata, exteriora \pm lanceolata-spathulata obtusa, caulina 2—3 attenuata sessilia, omnia fere integerrima, supra pilis modice numerosis 2—3 mm longis subpilosa. — Tirolia: Neuprags (Naegeli).

β) **vulgatiforme** N. P. l. c. Folia rosularia longe petiolata, caulinum infimum basin versus longe attenuatum reliqua attenuata v. \pm rotundata sessilia, omnia \pm serratodentata; involucrum 10—15 mm longum, squamae angustissimae, achaenia 3 mm longa, pili ubique 1,5—3 mm l. — Habitus fere *H. vulgati*, rami primarii saepe subconferti numerosiores quam in var. α . — Helvetia austro-occidentalis: Ormonts, in montibus Arpille et Palette (Naegeli).

Exsiccata: A. Peter, *Hieracia Naegeliana* no. 373 (var. α 1), no. 373* (var. α 2), no. 373** (var. β).

Tab. 32, Fig. A 1—2. *H. dentatum* Hoppe ssp. *subvillosum* N. P. α) **genuinum** N. P. 2) *undulatum* M. Z. (e monte Platzerberg juxta jugum Brenner, leg. J. Murr). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies **subbruncinatum** N. P., *Hierac. Mitteleurop.* II (1886) p. 180. — Caulis ad 45 cm altus crassus v. gracilis, subascendens subflexuosus, subtiliter striatus, phyllopodus, superne sat dense diluteque pilosus (3—5 mm) et albido- v. canotomentosus, inferne densius pilosus et usque ad basin deminute floccosus, omnino eglandulosus. Folia rosularia compluria subpetiolata oblonga v. lanceolata, \pm acuta v. acutiuscula mucronata, \pm grosse subbruncinato-dentata; caulina 4—5 sensim decrescentia, infimum basi attenuatum reliqua basi lata v. \pm subamplexicaulia; omnia glaucescentia rigidiuscula v. mollia, utrinque dense et molliter

pilosa (3—5 mm) effloccosa. Inflorescentia \pm furcata indeterminata 2—6 cephalae; acladium 5—13 cm longum, rami primarii 1—4 remoti crassiusculi v. graciles, 1—2 cephalae. Involucrum 14—16 mm longum globosum; squamae sublatiusculae lineares, longe acuminatae acutissimae, obscurae v. fere nigrae, dense et dilute pilosae (3—4 mm), superne subeffloccosae basin versus modice floccosae, disperse et minutissime glandulosae; bractae 4—5, infimae foliaceae v. lineares, summae squamis similes. Flores lutei, ligulae apice breviter ciliatae, stylus obscurus, achaenia brunea, 4 mm longa.

Crescit in alpinis calcareis inter 1550—2500 m. Jura: Creux du Van (Bulnheim); Helvetia: Ormonts (Naegeli), Bernhardin, Val Avers, Val Fex, St. Moritz, Val Chamuera, Piz Padella, Splügen, Parpan (N. P.), Mte. Generoso (Muret); Tirolia: in jugo Brenner, pr. Neuprags et versus Schludersbach, Fernpass, Nockspitz pr. Innsbruck (N. P.), Wormserjoch (Preissmann); Algovia: Rauhorn, Rappenkopf; in alpinis Bavariae: Schliersee, Benediktenwand (N. P.); Litorale Austriacum: Mte. Matajur (Peter). — Flor. Jul.-Aug.

Exsiccata: Dörfler, Herb. norm. no. 3138.

Tab. 32, Fig. B. 3—4. *H. dentatum* Hoppe ssp. *subruncinatum* N. P. (e monte Hoettingeralpe pr. Innsbruck, leg. J. Murr). 3. Squama. 4. Marginis folii portio.

Subspecies **pseudoporrectum** Christener, Hierac. d. Schweiz (1863) p. 18 (sine descr.) et in sched.; N. P. II 179. — Caulis ad 40 cm altus crassiusculus v. gracilis erectus saepissime parum flexuosus subtiliter substriatus phyllopodus. Folia rosularia complura, \pm breviter (interdum haud distincte) petiolata, oblongo-lanceolata v. lanceolata grosse dentata, exteriora obtusa v. obtusiuscula, interiora acuta; caulina 4—5 sensim decrescentia, infimum basi attenuatum, sequentia basi lata sessilia, \pm grosse dentata acuta; omnia parum glaucescentia mollia. Inflorescentia alte furcata indeterminata 3—6 cephalae; acladium 1—3 (—9) cm longum; ordines axium 2—3; rami primarii 2—4 valde remoti crassiusculi. Involucrum 15—16 mm longum ovatum demum ventricosum-globosum; squamae latiusculae longe acuminatae, exteriores acutissimae, interiores subobtusiusculae v. etiam acutissimae, omnes nigrae; bractae c. 2 \pm subulatae. Pili involucri satis numerosi diluti 2—3 mm longi, folia utrimque \pm dense pilosa, 2,5—3,5 mm, caulomata superne modice pilosa, inferne pilis subnumeris albis 3—4 (—5) mm longis obsita. Glandulae in involucri apicem squamarum versus dispersae v. nullae. Flocci: involucrum \pm disperse floccosum, folia effloccosa, caulomata superne albidotomentosa, inferne fere usque ad basin deminute floccosa. Flores subdilute lutei, ligulae apice glabrae, stylus fuscus; achaenia subdilute brunea, 4,5 mm longa.

Crescit in alpinis calcareis inter 1500—2370 m. Helvetia: ad pedem m. Wetterhorn pr. Grindelwald (Christener), in valle Eginental (Lagger), in m. Kalkberg supra Splügen, pr. Schuls (versus Muotta Naluns) in Rhaetia Engadinensi, in alpinis Abbatiszellen (Bamberger); Jura: Roetifluh (Christener); Tirolia: in valle Teischnitz pr. Kals (Pichler), in jugo Bergertörl pr. Kals, Kaserenwiesen pr. Neuprags (N. P.); in alpinis Bavariae: Schachen (Sendtner), Hochwies, Reitalpe, Benediktenwand, Miesing (N. P.); Carinthiae: Heiligenblut (Schnizlein).

Exsiccata: Hieracia Naegeliana no. 371.

Tab. 33, Fig. A. 1—2. *H. dentatum* Hoppe ssp. *pseudoporrectum* Christener (forma minus grosse dentata e valle Sertigtal pr. Davos 1880 m, leg. ipse). 1. Squama. 2. Achaenium.

Subspecies **Hoettingense** J. Murr, apud Zahn in Koch Synops. (1901) p. 1795 et in

Oesterr. bot. Zeitschr. (1902) p. 353; *H. pseudoporrectum* J. Murr in sched. et in Deutsch. bot. Monatsschr. (1897) p. 243. — Folia caulina saepe quoad formam et nervaturam transitum *dentatum* > *elongatum* exhibentia. Caulis 35—40 cm altus gracilis erectus saepe haud flexuosus substriatus phyllopodus. Folia rosularia complura petiolata oblongo-lanceolata denticulata v. subserrato-dentata, exteriora acutiuscula, interiora acuta, omnia in petiolum sensim angustata; caulina 4—5 sensim decrescentia, infimum utrinque longe angustatum subpetiolatum acutum, sequentia parum attenuata v. rotundata sessilia, media saepe supra basin subcontracta inconspicue subpanduriformia ± dentata ± breviter acuminata acuta; omnia viridia submollia. Inflorescentia alte furcata 1—3 cephalae; acladium 1—5 cm longum. Involucrum 11,5—13 mm longum ovatum demum globosum; squamae sublatiusculae longe acuminatae acutae v. acutiusculae nigrae. Bracteae c. 2 lineares v. subulatae. Pili in involucrio numerosi 2—3 mm longi, caulomata superne subpilosa v. pilosa inferne minus pilosa, 2—3 (—4) mm, folia subpilosa supra saepe glabrescentia. Glandulae in involucrio dispersae, interdum etiam in acladio solitariae. Flocci: involucrum disperse floccosum, folia effloccosa, caulina superiora in nervo dorsali subfloccosa, caulomata superne albidotomentosa, infra medium subeffloccosa v. fere usque ad basin parciflocca. Flores ± dilute lutei, ligulae apice glabrae, stylus luteus subfuscescens; achaenia brunea 3,5—4 mm longa.

Crescit in alpinis calcareis Tiroliae: Hoettinger Alpe pr. Innsbruck (loc. class.), Weissenbach in valle Ahrntal (Treffer), in valle Vennertal iuxta jug. Brenner (Baer).

Exsiccata: Dörfler, Herb. norm. cent. XXXII no. 3137 sub nom. *H. pseudoporrectum* (leg. J. Murr).

Tab. 33, Fig. B. 3. *H. dentatum* Hoppe ssp. *Hoettingense* Murr (e loc. class., leg. Murr). 3. Pedunculus sub involucrio.

Grex IV. Dentatiforme N. P.

Subspecies **Carinthicola** N. P., Hierac. Mitteleurop. II p. 185. — Caulis ad 20 (—27) cm altus gracilis v. subtenuis erectus subtiliter substriatus phyllopodus. Folia rosularia 2—5 petiolata lanceolata, sensim in petiolum attenuata, exteriora obtusa, interiora acuta saepe plicato-acuminata, argute et subregulariter serrata glaucescentia tenuia; caulina 2—4 sensim decrescentia basi sublata v. infima angustata sessilia acutissima. Inflorescentia altefurcata haud suprafastigiata 1—3 cephalae; acladium 1,5—4 cm longum; rami primarii 0—2 tenues monocephali. Involucrum 11—12 mm longum ovatum demum fere globosum; squamae sublatiusculae longe acuminatae acutissimae subnigrae parum dilute marginatae, exteriores sublaxae. Bracteae c. 2. Pili involucri modice v. sat numerosi diluti, caulomata mediocriter pilosa, folia superne marginem versus disperse v. parce pilosa subtus subpilosa, pili ubique 1,5—2 (—3) mm longi. Glandulae ubique nullae, in involucrio tantum dispersae minutae. Flocci involucri dispersi, caulomata superne albidotomentosa inferne deminute floccosa, folia effloccosa. Flores lutei abbreviati tubulosi, in dentes profundos incisi apice glabri; stylus obscurus; achaenia fere atra 3,8 mm longa.

Crescit in alpinis calcareis Carinthiae: Gartnerkofel et Auernig pr. Pontafel 1885—2080 m, Thörler Alp et Obere Fischbachalp pr. Raibl versus Kanadulscharte 1800—2050 m (Peter).

Tab. 34, Fig. A. 1—3. *H. dentatum* Hoppe ssp. *Carinthicola* N. P. (e valle Trogtal Carinthiae, leg. R. de Benz). 1. Flos. 2. Squama. 2. Pedunculi portio.

Subspecies **dentatiforme** N. P. II p. 186. — Caulis ad 25 cm altus tenuis flexuosus erectus phyllopodus. Folia rosularia 3—5 longe petiolata lanceolata v. anguste lanceolata

acuta v. acutiuscula mucronata denticulata v. breviter dentata saepius undulata vel plicata glaucescentia mollia; caulina 3—4 subsensim decrescentia lanceolata basi angustata. Inflorescentia furcata saepe parum suprafastigiata 1—3 cephala; acladium 3—7 cm longum; rami primarii 0—2 tenues monocephali. Involucrum 11—13 mm longum \pm globosum; squamae angustae longe acuminatae acutissimae obscurae v. subnigrae, exteriores immarginatae \pm laxae, interiores in margine subdilutiores. Bractee 3—5 subulatae. Pili involucri modice v. sat numerosi diluti 1—1,5 mm longi, caulomata superne modice pilosa, 1—1,5 mm, inferne densius pilosa, 2—3 (—4) mm, folia supra \pm subpilosa, subtus pilis subnumerosis v. numerosis obsita (2—3 mm l.). Glandulae minutissimae, in involucrio tantum solitariae. Flocci in involucrio sparsi, caulomata superne canotomentosa inferne usque ad basin deminute floccosa, folia effloccosa. Flores flavi, ligulae apice glabrae, stylus valde obscurus; achaenia distincte brunea, 3 mm l.

Crescit in alp. calc. inter 1500—2500 m. Helvetia: Sex rouge et Lécheret in Ormonts (Naeg.), Bonaudon inter Montreux et Allières (Lagger), Val Fex, inter Bivio et jugum Valettapass et in valle Avers usque ad pagum Croet, pr. Parpan versus m. Weisshorn et Schwarzhorn (Peter), in monte Valserberg pr. Hinterrhein (Naeg.); Tirolia: in montibus calc. vallis Oeni superioris praesertim pr. Innsbruck et Hall (Murr), in valle Vennertal iuxta iugum Brenner (Naeg.), Kaserenwiesen pr. Neuprags (Naeg.); Vorarlbergia: in m. Arlberg (Murr), in valle Malbun (Richen); Algovia: Kl. Rappenkopf, Schachen (Sendtner); Carinthia: Albitzenwiesen pr. Pasterzengletscher (N. P.).

Exsiccata: Hierac. Naegelianae no. 375; Baenitz, Herb. europ. sub nom. *H. dentatum* v. *coarctatum* Murr (Oesterr. bot. Zeitschr. 1891 p. 220; Allgem. bot. Zeitschr. 1895 p. 207).

Grex *Dentatum* N. P.

Subspecies **cuspidatifolium** Murr in sched (1898), Katalog Wien. bot. Tauschverein (1900), Österr. bot. Zeitschr. (1902) p. 354 — Caulis 17 ad 30 cm altus subtenuis v. gracilis erectus subflexuosus substriatus phyllopodus. Folia rosularia 2—5 breviter petiolata, exteriora minora spathulata saepissime emarcida, reliqua lanceolata spathulata obtusiuscula v. pleraque lanceolata acuminata cuspidata, remote denticulata aut dentata, dilute viridia subglaucescentia tenuia; caulina (1—) 2—3 cito decrescentia, infimum lanceolatum cuspidatum basin versus subattenuatum sessile, reliqua ovato-lanceolata v. anguste lanceolata longe acuminata acutissima. Inflorescentia alte furcata saepissime 2 cephalae; acladium 3—6 cm longum. Involucrum 12—14 mm longum ovato-globosum demum ventricatum; squamae latiusculae longe acuminatae acutissimae subnigrae, interiores virides submarginatae; bractae ca. 2 subulatae. Pili involucri satis numerosi 1—2,5 mm longi, caulomata superne modice pilosa inferne saepe minus pilosa, 1,5—3 mm, folia utrinque disperse pilosa, in margine petioloque et subtus in nervo mediano densius et molliter pilosa. Glandulae in involucro dispersae, pedunculi superne glandulis parvis solitariis praediti, caulis eglandulosus. Flocci involucri dispersi, pedunculi superne multiflocci v. leviter (obscurae) cani, caulis superne subfloccus. Flores saturate lutei, ligulae apice rarius ciliatae, stylus obscurus; achaenia nigro-brunea.

Crescit in alpinis calcareis inter 17—1900 m. Tirolia: Hoettinger Alpe pr. Innsbruck (Murr); Bavaria: in m. Schachen pr. Partenkirchen (idem).

Ex affinitate *H. lonchitis* N. P., sed minus pilosum et multo minus floccosum. Transitus subvillosus → Murrianum.

Tab. 35, Fig. A 1—2. *H. dentatum* Hoppe ssp. *cuspidatifolium* Murr (e m. Hoettingeralpe, leg. Murr). 1. Squama. 2. Pedunculus sub involucro.

Subspecies **prionodes** N. P. II p. 188. — Caulis ad 25 (—35) cm altus gracilis erectus flexuosus phyllopodus striatus, interdum usque ad basin ramosus. Folia rosularia complura, breviter petiolata, elliptica v. oblonga, obtusa v. acuta, grosse serrato-dentata; caulina 2—3 cito decrescentia lanceolata basi angustata, summum parvum lineare; omnia subglaucescentia viridia mollia. Inflorescentia furcata haud suprafastigiata indeterminata 3—6 cephalae; acladium 3,5—6 cm longum; rami primarii 2—5 valde remoti tenues monocephali. Involucrum 13—14 mm longum ovatum demum globosum; squamae angustae lineares sensim attenuatae acutissimae nigrae, angustissime diluteque marginatae, exteriores sublaxae v. subadpressae. Bractae c. 3 subulatae. Pili involucri satis numerosi diluti, 1—1,5 mm longi, caulomata modice v. sat dense pilosa, 2—3 mm, folia utrinque sat dense pilosa, 2,5—3 mm. Glandulae nullae, squamae apicem versus tantum sparsim et minutissime

glandulosae. Flocci involucri dispersi vel modice numerosi, squamae in margine multifloccae folia effloccosa, caulomata superne canotomentosa, inferne usque ad basin deminute floccosa. Flores intense lutei, ligulae apice non v. breviter ciliatae; stylus obscurus. Achaenia aterrima 4 mm longa.

Crescit in alpinis calcar. inter 15—2450 m. Tirolia: Vennertal, Griesberg et Wolfental iuxta iugum Brenner (Naegeli); Helvetia: in valle Eginental (idem).

Variat: 1) *normale* N. P. — Brenner.

2) *microcarpum* N. P. Achaenia brunea, 3 mm longa. Caulis sparsim v. medioeriter pilosus. Folia rosularia exteriora ovata v. elliptica obtusa, interiora oblonga acutiuscula, omnia longe petiolata. — Vennertal.

Exsiccata: Hieracia Naegelianae no. 377.

Tab. 36, Fig. A. 1—3. *H. dentatum* Hoppe ssp. *prionodes* N. P. 1) normale N. P. (e iugo Brenner, leg. Baer). 1. Dentes ligularum. 2. Squama. 3. Pedunculus sub involucrio.

Subspecies **Gaudini** Christener, Hierac. d. Schweiz (1863) p. 10; N. P. II p. 190; *H. pilosum* Schleich. exs. pp.; *H. Schraderi* v. *dentatum* Gaudin, Fl. Helv. V (1829) p. 69. — Caulis 10—20 (—35) cm altus gracilis v. tenuis erectus subflexuosus striatus phyllopodus. Folia rosularia complura petiolata lanceolata, acutiuscula v. acuta mucronata, exteriora oblonga v. fere obovata rotundato-obtusa; caulina 2—3 cito decrescentia, summum parvum ± lanceolatum basi angustatum sessile; omnia dilute viridia parum glaucescentia, integerrima v. remote denticulata v. subdentata mollia. Inflorescentia furcata, saepe ± suprafastigiata, 1—2 (—4) cephalae; acladium 4—13 cm longum; rami primarii 0—1 (—3) tenues monocephali. Involucrum 13—15 mm longum ovatum demum ± globosum; squamae angustae lineares longe acuminatae acutissimae, obscurae, exteriores laxae. Bractae c. 3 fere subulatae. Pili in involucrio satis numerosi diluti 2—3 mm longi, caulomata modice v. sat dense pilosa (3—4 mm), folia supra pilis 3—4 l. sparsis v. subnumerosis mollibus subtus densis obtecta. Glandulae nullae, squamae apicem versus disperse et minute glandulosae. Flocci involucri ± sparsi, caulomata superne canotomentosa, inferne usque ad basin floccosa, folia caulina superiora subtus in nervo dorsali disperse floccosa, reliqua effloccosa. Flores saturate lutei, ligulae apice glabrae v. saepissime subciliatae; stylus obscurus. Achaenia nigro-brunea v. aterrima, 3—3,8 mm longa.

Crescit locis petroso-schistosis calcareis alpinis inter 1350—2600 m.

Variat: 1) *normale* N. P. — Helvetia: Les Morteys (Jaquet), Montbovon, Château d'Oex, Bonaudon (Leresche, Lagger), Stockhornkette (Christener), in alpinis v. Simmental (Maurer); Ormonts (Naegeli), in alpinis supra Bex non infrequens (Muret), Sanetsch, Rawyl (Wolf) etc., Helvetia orientalis: Parpan, Albula, Engadin, Bernina, Splügen (N. P.), Sertig (Zahn) Scesaplana (N. P.) Tirolia: Fernpass, Kerschbaumer Alpe (Naegeli, Huter); Algovia: Kegelköpfe, Kl. Rappenkopf, (N. P.).

2) *villosius* N. P. Involucrum et caulomata densius pilosa, caulis longe pilosus (—6 mm); rami primarii interdum 3—4. — Helvetia: Ad pedem m. Wetterhorn (Christener), Gemmi (Naeg.), Zandalp (Wolf); Frohnalp, Mürtchenstock, Albula, Val del Fain, Piz Alv (Naeg.), Piz Padella, Val Fex (Peter); Vorarlbergia: Scesaplana; Algovia: Hochvogel (Sendtner); Tirolia: Arlberg (N. P.), Imst (Naeg.); Bavaria: Schachen p. Partenkirchen (N. P.).

3) *tubulosum* N. P. Flores tubulosi stylosi; pili involucri numerosi 3—4 mm longi. — Val Avers: inter Cresta et Valettapass, Parpan (Peter).

Exsiccata: Fries, Hier. europ. exs. 35bis pp.; F. Schultz, Herb. norm. nov. ser. no. 1813; Hierac. Naegel. no. 379.

Tab. 36, Fig. B. 4—8. *H. dentatum* Hoppe ssp. *Gaudini* Christener 1) *normale* N. P. (e Luchernalpe in valle Simmental, leg. Kaeser). 4. Squama. 5. Pedunculus sub involucrio. 6. Caulis portio. 7. Nervus dorsalis (fol. caul.). 8. Achaenium.

Subspecies **callianthoides** Arv.-Touv. et Briq., Bull.-Soc. Murithienne XXVIII (1900) p. 70. — Forsan varietas maculata *H. dentati* ssp. *dentatum*! Caulis 20 ad 25 cm altus gracilis erectus saepe subflexuosus subtiliter striatus phyllopodus. Folia rosularia numerosa breviter petiolata, exteriora minora obovata obtusa saepissime emarcida, interiora conspicua elliptica v. oblongo-lanceolata v. lanceolata acutiuscula v. acuta mucronata, remote denticulata, dilute viridia subglaucescentia intense violacea et supra bruneo-maculata rigiduscula sensim in petiolum attenuata; caulina (1—) 2—3 (—5) cito decrescentia, late lanceolata basi angustata sessilia, superiora saepissime non evoluta bracteiformia lineari-lanceolata acutissima. Inflorescentia fere semper monocephala. Involucrum 14—16 mm longum late globosum demum late ventricosum-globosum depressum; squamae angustae acutissimae obscurae adpressae. Bractee 2—4 anguste lineares elongatae. Pili in involucrio sat numerosi diluti, 2—3 mm longi, caulomata superne subdense pilosa, 2—2,5 mm, inferne subpilosa, folia utrimque modice pilosa, in margine et subtus in nervo mediano densius pilosa, 1—2 mm. Glandulae ubique nullae, squamae apicem versus glandulis minutissimis obsitae. Flocci involucri subnulli, caulomata superne tomentosa, inferne effloccosa, folia effloccosa. Flores intense lutei, ligulae apice subglabrae, stylus obscurus; achaenia brunea.

Crescit in jugo Col de Lovenex! 1760 m sub m. Grammont Valesiae (entre le vallon de Novel et Haut de Taney), leg. Briquet. — Collegi exemplaria speciosa m. Aug. 1905 in consortio *H. dentati* ssp. *dentatum* Hoppe quocum valde affine, sed differt squamis angustioribus et foliis supra intense maculatis.

Subspecies **Waldense** Murr, Allgem. bot. Zeitschr. (1899) p. 42 et in Koch Synops. (ed. Hall.-Wohlf.) 1901 p. 1796. — Caulis 17—30 cm altus gracilis v. subtenuis erectus subflexuosus inconspicue striatus phyllopodus. Folia rosularia complura petiolata, exteriora minora elliptica obtusiuscula, interiora oblongo-lanceolata utrinque acuminata acuta mucronata dilute viridia parum glaucescentia submolliora mucronata- et serrato-dentata v. denticulata; caulina 2 (—3) cito decrescentia, infimum late lanceolatum \pm longe acuminatum acutum basi angustatum v. ut summum basi \pm rotundatum sessile. Inflorescentia altefurcata 1—3 cephalata; acladium 2—7 cm longum; rami primarii 0—2 remoti monocephali. Involucrium 12—14 cm longum ovatum; squamae sublatiusculae longe acuminatae acutae, exteriores

saepe acutiusculae obscurae adpressae, interiores margine pallide¹ virides. Bractee c. 2 subulatae. Pili involucri modice numerosi 1—2 mm longi, caulomata mediocriter pilosa, 1—3 mm, folia utrinque subpilosa v. supra minus pilosa, pilis mollibus 2—3 mm longis obsita. Glandulae involucri fere nulli. Flocci involucri subnumerosi, in margine squamarum densiores, caulomata superne canotomentosa, inferne deminute floccosa basin versus fere effloccosa, folia caulina subtus in nervo mediano subfloccosa. Flores saturate lutei, ligulae apice glabrae, stylus fuscus; achaenia nigro-brunea.

Crescit locis petrosis pr. Wald (loco dicto Hühnerkaar) Stiriae superioris (E. Khek).
Habitus *H. dentati*, involucrum fere ut in *H. subspeciosum*.

Tab. 39, Fig. A. 1—3. *H. dentatum* Hoppe ssp. *Waldense* Murr (e loc. class., leg. E. Khek). 1. Squama. 2. Pedunculus sub involucro. 3. Nervus dorsalis fol. caul.

Subspecies **rumicifolium** Murr in sched. et apud Zahn, in Koch Syn. (1901) p. 1797; Murr, Oesterr. bot. Zeitschr. (1902) p. 354. — Caulis 30—40 cm altus gracilis erectus flexuosus subtiliter substriatus phyllopodus. Folia rosularia 3—6 petiolata, exteriora minora ovata obtusa saepe emarceida, reliqua elliptica v. oblongo-lanceolata acutiuscula v. utrinque acuminata in petiolum alatum decurrentia acuta mucronata remote denticulata (v. saepe unus tantum dens more *Rumicis acetosellae* magis evolutus), dilute viridia subglaucescentia tenuia; caulina 3 (—4) subsensim decrescentia, infima lanceolata acuminata in petiolum alatum longe attenuata, superiora basin versus angustata subsessilia cuspidata. Inflorescentia 1- cephala v. furcata 2—5 cephala; acladium 3,5 cm — c. $\frac{1}{3}$ totius caulis. Involucrum 14—15 mm longum late ovatum; squamae subangustae longe acuminatae acutissimae obscurae, interiores \pm viridimarginatae; bractee c. 2—3 subulatae. Pili involucri numerosi basi obscuri 1—2 mm longi caulomata superne pilis basi obscuris subpilosa, inferne minus pilosa, caulis basin versus disperse pilosus, 2—3 mm, subviolaceus (ut interdum petioli foliorum), folia fere epilosa, in margine petioloque tantum disperse pilosa, basin versus magis pilosa, 1—2 mm. Glandulae in involucro dispersae, in pedunculis interdum subsolitariae. Flocci involucri subnulli, squamae in margine basin versus subfloccosae, pedunculi multiflocci v. superne tantum leviter tomentosi, caulis superne multifloccus, infra medium effloccosus. Ligulae luteae, apice saepe subciliatae; stylus demum subfuscescens; achaenia brunea. — Verosimiliter hybridum ex *H. glabratoide*s Murr et *H. dentatum*.

Crescit in albis calcareis confinii Tiroliae et Bavariae: locis glareosis Dammkar pr. Mittenwald (det. et leg. J. Murr).

Tab. 39, Fig. B. 4, 5. *H. dentatum* Hoppe ssp. *rumicifolium* Murr (e loc. class.).
4. Squama. 5. Pedunculus sub involucro.

28. Hieracium incisum Hoppe, apud Sturm, Deutschl. Flora fasc. 39; Zahn, in Koch Synops. (1901) p. 1797; *H. incisum* Koch, Syn. ed. 2 II (1844) p. 523 pp.; Sendtner, in Flora (1854) p. 342; Fries, Epicr. (1862) p. 62; non Griseb., Comm. II p. 120; Zahn l. c. — Habitus *H. dentati* v. *H. silvatici*. Caulis 10—40 cm altus subtenuis v. gracilis ascendens v. erectus saepe subflexuosus \pm striatus basin versus saepe violaceus phyllopodus. Folia rosularia pauca v. complura (4—8) petiolata ovata elliptica v. oblonga lanceolata, sensim

v. \pm abrupte basin versus attenuata v. (praecipue exteriora) basi rotundata truncata interdum \pm cordata, apice rotundata v. obtusiuscula v. acutiuscula acutave, dentata basin versus saepe grosse dentata ut in *H. silvatico*, dilute v. saturate v. obscure viridia saepe subglaucescentia, subtus saepe violacea, sat mollia v. rigidiuscula; caulina 0—2 cito decrescentia radicalibus \pm similia lanceolata v. linearia. Inflorescentia furcata v. laxe paniculata \pm suprafastigiata 1- oligocephala rarius pleiocephala; acladium 1—8 cm ($-\frac{2}{3}$ totius caulis), rami primarii 0- pauci \pm remoti monocephali v. simpliciter ramosi. Involucrum ventricosum-globosum v. ovatum 10—15 mm longum; squamae saepissime angustae longe acuminatae \pm acutae v. acutissimae subobscurae v. atrae saepe \pm dilute marginatae. Bractee paucae v. complures. Pili involucri densissimi v. mediocriter numerosi sat longi v. breves, 1—2,5 mm, albi basi obscuri v. obscuri, pedunculi dense v. modice v. disperse pilosi, caulis sat dense v. disperse v. fere non pilosus, folia supra \pm epilosa v. densipila, subtus fere semper mediocriter v. dense pilosa, pili molles v. supra \pm rigidi, in margine nervo dorsali petioloque subdense v. densissimi, petiolus saepe \pm longe villosus (1—3—4 mm). Glandulae involucri pedunculique solitariae v. modice numerosae, caulis superne glandulis parum numerosis obiectus vel omnino eglandulosus. Flocci involucri dispersi v. \pm numerosi, pedunculi multiflocci v. tomentosi, caulis deminute floccosus basin versus subfloccosus v. effloccosus, folia effloccosa (v. superiora etiam subtus) v. in nervo dorsali tantum subfloccosa. Flores sat magni, saturate lutei v. aurei, stylus obscurus, ligulae glabrae rarius subciliatae; achaenia \pm atra.

Crescit per alpes Italiae, Galliae, Helvetiae, Germaniae australis, Austriae, Transsilvaniae, Bosniae, saepissime in consortio *H. dentati* et villosi. — Flor. Jul.-Aug.

Dispositio gregum:

- a) *Murrianum* Zahn, in Koch Syn. p. 1797. Habitus *H. dentati*, caulis oligocephalus, acladium longum, capitula sat magna obscura \pm dense et obscure villosa, glandulae \pm sparsae.
- b) *Trachselianum* Zahn l. c. p. 1799. Habitus inter *H. dentatum* et *H. subspicosum*. Formae intermediae inter *H. dentatum* et *H. bifidum*; v. inter *H. dentatum* Grex *Dentatiforme* v. *Expallens* et *H. silvaticum* (v. *bifidum*) quasi intermediae. Caulis saepe pleiocephalus, acladium saepe breve, capitula minora modice v. dense floccosa, dilute breviterque subvillosa v. tantum disperse pilosa fere eglandulosa. Folia \pm lanceolata in petiolum \pm angustata \pm glabra dilute viridia subglaucescentia rigidiuscula, exteriora saepe \pm spatulata.
- c. *Incisum* Zahn l. c. 1800. Habitus *H. silvatici*, at capitula maiora minus numerosa, acladium longius, ligulae speciosae, squamae acutae v. acutissimae subvillosae.

Grex *Murrianum*.

Subspecies ***Murrianum*** Arv.-Touv. in litt. 1890, et apud J. Briquet in Bull. herb. Boissier II (1894) p. 629 pp.; Murr in Progr. d. Realschule Innsbruck (1891) p. 55 et in sched. ad herb. norm. nov. ser. no. 3126 et Deutsche bot. Monatsschr. (1898) p. 5. — Caulis (15—) 25—30 cm altus. Folia rosularia 5—7 sat longe petiolata, exteriora ovata obtusissima vel cochleariformia, interiora oblonga v. lanceolata acutiuscula v. acuta, abrupte v. sensim in petiolum angustata, dentata v. grosse dentata (praecipue basin versus) v. inciso-dentata dentibus \pm in petiolum descendentibus, omnia canoviridia glaucescentia mollia; caulina 0—1 (—2) lanceolata v. linearia saepe petiolata et \pm dentata, inferius haud multum supra basin insertum. Inflorescentia 1- vel furcata 2 (—3) cephalae; acladium 3,5—8,5 cm longum, rami primarii 0—1 (—2) saepissime monocephali. Involucrum 12—15 mm longum ovato-globosum demum \pm depressum; squamae subangustae acutiusculae v. acutae subnigrae margine obscure virides; bractee 2. Pili in involucrio satis numerosi 1—2,5 mm longi diluti basi obscuri,

caulomata disperse v. mediocriter pilosa, folia supra saepissime glabra, in margine petioleque et subtus in nervo dorsali subdense pilosa (1—3 mm), lamina subtus disperse pilosa. Glandulae involucri dispersae, in pedunculis \pm solitariae. Flocci involucri basin versus modice numerosi, pedunculi superne canotomentosi, caulis saepe usque ad basin subfloccosus, folia caulina in nervo dorsali tantum subfloccosa vel omnino effloccosa. Flores interdum tubulosi, ligulae subciliatae, stylus obscurus; achaenia subatra.

Crescit in alpinis calcareis inter 1350—2100 m. Helvetia: Creux de Champ (Tout.), Simmental (Kaeser), Adelboden (Dutoit), Unterschächental (Correns), Piz Padella (Candrian); Tirolia: Innsbruck et Hall (Murr), Berglital pr. Leutasch (id.); Bavaria: Wettersteinalpe (id.); Stiria: Zeyritzkampel pr. Kalwang (Correns).

Exsiccata: Dörfler, Herb. norm. no. 3126.

Tab. 40, Fig. A. 1—3. *H. incisum* Hoppe ssp. *Murrianum* A.-T. (e monte Höttingeralpe pr. Innsbruck, leg. Murr). 1. Dentes ligularum. 2. Squama. 3. Portio pedunculi.

Subspecies **anthyllidifolium** Murr, Deutsch. bot. Monatsschr. (1890) p. 110, ibid. (1898) p. 6; Progr. d. Realsch. Innsbruck (1891) p. 55; *H. rhoeadifolium* Murr, Oesterr. bot. Zeitschr. (1889) p. 12, non Kerner. — Caulis (15—) 20—30 cm altus. Folia rosularia 4—6 petiolata oblongo-ovata v. oblonga, interiora interdum lanceolata rotundata obtusa v. acutiuscula basin versus rotundata v. \pm cito angustata, subdenticulata v. integerrima rarius basin versus inconspicue sinuato-dentata, obscure viridia, supra saepissime nuda subnitentia subtus breviter molliterque subpilosa; caulina 1—2 (—3) lanceolata integra, superiora parva. Inflorescentia vulgo altefurcata interdum \pm indeterminata 1—5 (—12) cephalae; acladium 20—35 mm (— $\frac{1}{3}$ totius caulis); rami primarii 0—3 (—5) saepissime monocephali. Involucrum crassum ovatum 12—15 mm longum; squamae angustae acutae, mediocriter sparsimve floccosae subeglandulosae dense et breviter pilosae (pilis obscuris), pedunculi \pm cani fere eglandulosi. Bractee 3—6 infimae interdum subfoliaceae lineares. Ligulae luteae apice glabrae, stylus obscurus; achaenia subatra.

Crescit in alpinis calcareis inter 16—1800 m. Tirolia: Innsbruck, Hall (Murr), Marienberg pr. Obsteig (Poell), Schnanner Loch (Preissmann), Kaiserjoch pr. Pettneu (Gremblich); Vorarlbergia: in monte Arlberg supra Stuben (Murr); Helvetia: Samaden (Candrian).

Variat 2) *dentatum* Murr in sched., et in Koch Syn. (1901) p. 1799. Folia rosularia basin versus grosse dentata. — Arlberg (Murr).

Exsiccata: Dörfler, Herb. norm. no. 3127.

Tab. 40, Fig. B. 4—6. *H. incisum* Hoppe ssp. *anthyllidifolium* Murr (e m. Arlberg, leg. Murr). 4. Squamae. 5. Pedunculus sub involucri. 6. Achaenium.

Subspecies **Hittense** Murr, in Sched. herb. norm. cent. XXXII p. 42 (1897), Deutsch. bot. Monatsschr. (1898) p. 5 et in Koch Synops. (1901) p. 1798. — Caulis 24—40 cm altus. Folia rosularia 5—8 brevius longius petiolata, exteriora elliptica obtusa basi truncata v. rotundata, plurima \pm oblongo-lanceolata v. lanceolata, \pm in petiolum angustata, omnia remote denticulata v. (praecipue basin versus) grosse dentata dentibus acutis antrorsum versis, utrinque disperse pilosa supra saepe glabrescentia, in margine breviter (in petiolo longius) subvillosa obscure viridia; caulinum 0—1 anguste lanceolatum saepissime integerrimum v. lineare. Inflorescentia altefurcata 1—3 (—4) cephalae; acladium 1—5 cm (— $\frac{1}{3}$ totius caulis); bractee c. 3. Involucrum ovato-globosum ad 15 mm longum; squamae angustae, exteriores acutiusculae (saepe obtusiusculae), interiores acutae, omnes subdense et obscure pilosae (pilis basi

atris) modice floccosae disperse glandulosae, caulomata subpilosa superne subcana inferne subfloccosa, pedunculi parce glandulosi. Ligulae saturate luteae apice subglabrae, stylus obscurus, achaenia subatra. Subsp. derivata a *H. dentato* ssp. *dentatiformi*, habitu etiam *H. nigrescens* Willd. haud parum revocans.

Crescit in alpinis calcareis inter 14—2000 m. Tirolia: Innsbruck: Frau Hitt et Höttinger Alpe (Murr), Ahrntal (Treffer); Vorarlbergia: in iugo Arlberg supra Stuben (Murr); Bavaria: in m. Schachen pr. Partenkirchen (Murr); Helvetia: in m. Windgaelle versus Mettener Bützli (Correns), Curfirsten (Bruegger).

Variat β . **Montafonense** Murr, in Herb. Kaeser (1899), et in Koch Syn. (1901) p. 1798. Involucrum 10—12 mm l. \pm ovatum, squamae acutae ut caulis et folia magis pilosae mediocriter v. dense floccosae, pedunculi tomentosi, caulis usque ad basin floccosus; capitula 2—3 (—4), acladium 20—25 mm, involucra pedunculique sparsim v. mediocriter glandulosa. — Helvetia orientalis: Kistenstöckli, Piz Dado, Griestal (Correns); Vorarlbergia: Gamperdonatal supra St. Rochus (Murr).

Tab. 41, Fig. A. 1—4. *H. incisum* Hoppe ssp. *Hittense* Murr (e iugo Arlberg supra Stuben, leg. Murr). 1. Squama (apex). 2. Squama. 3. Pedunculus sub involuero. 4. Achaenium.

Subspecies **pseudomurrianum** Zahn, in Koch Syn. (1901) p. 1798; *H. Murrianum* A.-T. et Briq., Bull. Herb. Boissier II (1894) p. 629, non A.-T. in litt. ad Murr (1890), nec Murr, in Progr. Innsbr. Realschule (1891) p. 55. — Caulis 15—20 cm altus. Folia rosularia 3—6 petiolata, exteriora ovata obtusiuscula v. oblongo-lanceolata acuminata acuta, in petiolum abrupte v. sensim attenuata argute serrato-dentata viridia, caulina 1 (—2) lanceolata utrimque attenuata cuspidata paucidentata, summum saepissime lineare v. subulatum. Inflorescentia monocephala rarius furcata dicephala, acladium c. $\frac{1}{3}$ totius caulis exhibens. Involucrum 12—13 mm c. longum late ovatum demum depressum; squamae subangustae longe acuminatae acutae obscurae fere immarginatae; bractae c. 2 subulatae. Pili involucri numerosi 1—2 mm longi albi basi obscuri, caulomata mediocriter pilosa, 1—2,5 mm, folia supra subglabra in margine et subtus molliter subpilosa, 1—1,5 mm, petioli breviter subvillosi. Glandulae in involuero subsolitariae, pedunculi fere eglandulosi. Flocci involucri subnumerosi, pedunculi superne obscure cani, caulis multifloccus basin versus effloccosus, folium caulinum subtus in nervo mediano subfloccosum. Flores saturate lutei, ligulae apice fere glabrae, stylus obscurus, achaenia subatra.

Crescit in alpinis calcareis Sabaudiae (Briquet), Tiroliae: Ahrntal (Treffer), Val di Ledro (Porta), Carinthiae: Alpe Klein-Kordin (R. de Benz).

Tab. 41, Fig. B. 5—8. *H. incisum* Hoppe ssp. *pseudomurrianum* Zahn (e alp. Kl.-Kordin, leg. R. de Benz).

Grex Trachselianum.

Subspecies **porrectiforme** Murr. Caulis ad 35 cm altus subtenuis erectus subflexuosus subtiliter striatus phyllopodus. Folia rosularia complura \pm longe petiolata, exteriora minora ovata v. elliptica apice rotundata v. acutiuscula basi truncata v. subcuneata, interiora elliptico-lanceolata breviter acuta v. acuta, dentata v. irregulariter grosse dentata, exteriora saepe denticulata, omnia viridia subglaucescentia papyracea; caulina 1—2 remota subsessilia, inferius radicalibus simile saepe basin versus angustatum subpetiolatum, superius lanceolatum v. lineare. Inflorescentia alte furcata 1—2 (—4) cephalae; acladium 3—5 cm longum; rami primarii (0—) 1 (—2) remoti 1 (—2) cephalae. Involucrum 10—12 mm longum ovatum demum subdepressum; squamae subangustae acuminatae acutae, intimae acutissimae, exteriores sub-

angustiores, omnes atrovirides dilutius virideque marginatae. Bractee ca. 3 subulatae. Pili in involucrio modice numerosi diluti 1—2 mm longi, caulomata subpilosa, 1—3 mm, folia supra glabra subtus subpilosa, in margine petioloque ut in nervo dorsali subdensius pilosa, 1—2,5 mm. Glandulae in involucrio valde dispersae, in pedunculis solitariae. Flocci involucri basin versus subnumerosi, pedunculi superne canotomentosi inferne subfloccosi, caulis superne subfloccosus inferne effloccosus, folia effloccosa. Flores saturate lutei, ligulae apice glabrae; stylus obscurus. Achaenia fere atra 3,5—4 mm longa. Ex huc subspecie et *H. villosa* vel dentato *H. Hoettingense* Murr ortum esse videtur.

Crescit in alpidis calcareis Tiroliae: Hoettinger Alpe versus iugum „Sattel“ (detex. et leg. J. Murr).

Tab. 42, Fig. A. 1—4. *H. incisum* Hoppe ssp. *porrectiforme* Murr (e loc. class.). 1. Dentes ligularum. 2. Squama. 3. Pedunculus sub involucrio. 4. Achaenium.

Subspecies ***rhoeadifolium*** A. Kerner in sched. (1873) et apud Zahn, in Koch Synopsis (1901) p. 1799. — Caulis (20—) 30—40 cm altus subtenuis subflexuosus subtiliter striatus saepe subascendens phyllopodus. Folia rosularia complura mediocriter petiolata, exteriora obovata spatulata obtusa mucronulata, interiora oblongo-lanceolata v. lanceolata \pm acuta, omnia in petiolum \pm longe decurrentia denticulata v. basin versus dentata subsinuata, dilute viridia glaucescentia saepe subtenuia; caulina 0—2 lanceolata v. linearia, inferius saepe denticulata. Inflorescentia altefurcata 1—3 (—8) cephalis; acladium 4—8 cm ($-\frac{1}{2}$ — $\frac{2}{3}$ totius caulis) longum; rami primarii 0—2 saepe valde remoti monocephali v. simpliciter ramosi. Involucrium 12—14 mm longum ovatum demum subglobosum; squamae angustae acutissimae obscurae, marginem versus obscure virides. Pili involucri modice numerosi v. sat densi diluti, in pedunculis subnumerosi, caulis fere epilosus, folia supra glabra subtus praecipue in nervo dorsali ut etiam in margine petioloque molliter subpilosa, 1—3 mm. Glandulae involucri pedunculique subnulli. Flocci in involucrio numerosi v. sat densi, pedunculi superne cani inferne multiflocci, caulis multifloccus basin versus saepissime subfloccosus, folia caulina in nervo dorsali parce floccosa. Flores lutei, ligulae apice glabrae; stylus obscurus. Achaenia fere atra, 3,5—4 mm longa.

Crescit in alpidis calcareis Tiroliae: Gamsschrofen an der Wasenwand in v. Gschnitz (A. Kerner), in m. Platzerberg p. Gossensass 21—2300 m (Huter); Helvetiae: in alpe Braunwaldalpe p. Linthtal (Bernoulli).

Tab. 42, Fig. B. 5—9. *H. incisum* Hoppe ssp. *rhoeadifolium* A. Kerner (e m. Platzerberg p. Gossensass, leg. J. Murr). 5. Dentes ligularum. 6. Squama exterior. 7. Squama interior. 8. Pedunculus sub involucrio. 9. Portio fol. caul. pars aversa.

Grex *Incisum*.

Subspecies ***laceridens*** Murr, apud Zahn in Koch Synopsis (1901) p. 1800, et in sched. — Caulis 20—50 cm altus subflexuosus subtiliter striatus erectus gracilis phyllopodus. Folia rosularia complura longe petiolata ovata v. oblongo-lanceolata, exteriora basi rotundata v. truncata apice subobtusata, interiora in petiolum \pm breviter angustata acutiuscula v. acuta, omnia denticulata v. \pm grosse dentata v. incisa dentibus saepe in petiolum decurrentis, \pm saturate viridia subglaucescentia mollia v. subpapyracea; caulinum 0—1 lanceolatum dentatum v. lineare. Inflorescentia \pm determinata 2—5 (—10) cephalis; acladium 10—30 (—100) mm longum; rami primarii 1—4 (—6), infimi \pm remoti monocephali v. simpliciter tripliciterque ramosi. Involucrium 10—12 mm longum ovatum; squamae angustae acutae obscurae viridi-

marginatae. Bracteeae 2—3 subulatae. Pili involucri modice numerosi breves, pedunculi superne subpilosi inferne minus pilosi, caulis superne fere epilosus, inferne subpilosus, folia supra fere glabra v. parcepilosa, subtus submodice breviterque pilosa, in nervo dorsali margineque ut in petiolo densius breviter pilosa. Glandulae involucri pedunculique modice numerosae. Flocci involucri modice numerosi v. numerosissimi, pedunculi canotomentosi, caulis superne multifloccus basin versus calvus. Flores saturate lutei v. aurei, ligulae apice glabrae; stylus subluteus demum fuscescens. Achaenia atra 3,5—3,8 mm longa.

Crescit in alpinis calcareis Tiroliae: In m. Platzerberg p. Gossensass (Murr), Riedberg, Zeragalpe, Daxspitz (Huter), St. Jakob in v. Ahrn (Treffer); Carinthiae: Fischbachalp p. Raibl (Huter).

Variat: b) *subrhoeadifolium* Murr, foliis rosularibus oblongis vel ovatis apice obtusis vel obtusissimis \pm undulate dentatis; originem ducit ab *H. rhoeadifolio* Kerner.

Tab. 43. *H. incisum* Hoppe ssp. *laceridens* Murr (e m. Platzerberg). 1. Dentes ligularum. 2, 3. Squamae. 4. Pedunculus sub involucrio. 5. Achaenium. 6. Folia rosularia var. *subrhoeadifolii* Murr (ex eodem loco).

Subspecies **humiliforme** Murr, apud Zahn in Koch Syn. (1901) p. 1801. — Caulis (15—) 20—30 cm altus erectus (saepe valde) flexuosus \pm striatus phyllopodus. Folia rosularia complura brevius longiusve petiolata ovata elliptica v. oblonga obtusa v. obtusissima interdum acutiuscula basi truncata v. subdecurrentia saepe subcordata, grosse et late dentata v. praecipue basin versus profunde dentata v. sinuato-lobata more *H. humilis*, dentibus saepe in petiolum decurrentis; caulinum 0—1 lineare v. longe subulatum; omnia dilute viridia subglaucescentia mollia. Inflorescentia alte furcata 1—4 cephalae; acladium (12—) 30—80 mm; rami primarii 0—3 remoti 1— (rarissime 2—) cephalae. Involucrum 12—15 mm longum ovatum demum depressum; squamae angustae acutissimae obscure cinereae. Bracteeae 1—2 subulatae. Pili involucri subnumerosi albidii 1—2 mm longi, pedunculi breviter molliterque subpilosi, caulis superne parcepilosus, basin versus subpilosus, folia supra subpilosa v. calvescentia subtus subpilosa, in nervo mediano petioloque pilis albis ad 4 mm longis molliter subvillosa, in marginesubdensepilosa. Glandulae involucri pedunculiquesubnullae v. dispersae. Flocci involucri numerosi v. densi, pedunculi canotomentosi, caulis superne dense floccosus inferne usque ad basin subfloccosus, folia rosularia interiora et caulinum in nervo dorsali subfloccosa. Flores lutei, ligulae apice glabrae; stylus luteus, demum saepe subfuscescens. Achaenia atra.

Crescit in alpinis calcareis Tiroliae: Platzerberg iuxta iugum Brenner (Murr), Höttinger Alpe pr. Innsbruck, in iugo Lavatsch p. Hall (Murr), inter iugam Rolle et Cimon della Pala (A. et K. Touton); Helvetiae: Sertigtal p. Davos (Zahn).

Variat: β) **supracalvum** Zahn. Folia supra glabra. Helvetia: Col des Essets (Favrat), La Hausseresse p. Château-d'Oex (Leresche), Wandfluh p. Abläntschen (Schroeter et Wilczek), Waldnachtalp iuxta iugum Surenen (Gisler), Flims (Bernoulli), Val Tuors (Schröter), Strelapass (Bruegger), Sertigtal (Zahn), Albula (Bruegger), Valettapass (Favrat); Italia: Grignadi Mandello (Gysperger).

Tab. 44, Fig. A. 1—4. *H. incisum* Hoppe ssp. *humiliforme* Murr [α] *genuinum* Zahn, Monogr. Hier. helv. ined.] (e iugo Lavatsch). 1. Dentes ligularum. 2. Squama. 3. Pedunculus sub involucrio. 4. Limbi folii portio.

Subspecies **Gelmianum** Sarnthein, in Oesterr. bot. Zeitschr. (1894) p. 275; *H. nivale* Gelmi, Prospetto Fl. Trentino (1893) p. 106, nec Froel. Inter *H. dentatum* et *H. senile*

A. Kerner. Caulis 15—25 cm altus erectus subflexuosus subtiliter striatus subtenuis. Folia rosularia complura elliptica v. oblonga in petiolum brevius longius attenuata obtusiuscula v. acuta, basin versus grosse et late sinuato-dentata valde glaucescentia; caulinum 0—1 lineare. Inflorescentia altefurcata 1—2 cephalae; acladium 3—8 cm longum; rami primarii 0—1 monocephali. Involucrum 12—15 mm longum ovatum demum subglobosum, squamae angustae acutae. Bracteae 4—7 subulatae in squamas decresecentes. Pili involucri subnumerosi, caulomata breviter subvillosa, folia supra glabra, in margine petioloque dense pilosa v. subvillosa. Glandulae subnullae. Flocci involucri inferne subnumerosi, pedunculi cani. Flores lutei, ligulae apice glabrae; stylus fuscus; achaenia fere atra.

Crescit in alpibus calc. Tiroliae australis: in montibus Brenta (leg. Gelmi).

Tab. 44, Fig. B. 5, 6. *H. incisum* Hoppe ssp. *Gelmianum* Saroth. (sec. spec. Gelmianum e herb. Kaeseri!). 5. Squama. 6. Pedunculus sub involucri.

Subspecies **tephrochlorum** Zahn, in Allgem. bot. Zeitschrift (1901) p. 115; *H. incisum* Hoppe ssp. *leptopogon* M. et Z., in Oesterr. bot. Zeitschrift (1902) p. 389, nec Ehrenberg. Caulis 12—35 cm altus erectus v. ascendens subtenuis v. gracilis subflexuosus phyllopodus. Folia rosularia c. 6 petiolata ovata elliptica v. oblonga v. oblongo-lanceolata rotundata-obtusa v. acutiuscula (interiora acuta) denticulata basin versus dentata v. satis grosse dentata, saturate viridia subglaucescentia, subtus albido-viridia, subrigida; caulinum 0—1 lineari-lanceolatum valde elongatum v. lineare. Inflorescentia saepissime altefurcata 2—4 cephalae; acladium 2—8 cm ($-\frac{1}{2}$ totius caulis) longum; rami primarii 1—2 (-3) remoti monocephali oblique erecti. Involucrum 13—14 mm longum ventricosum-ovatum demum depressum; squamae angustae longe acuminatae acutiusculae v. acutissimae obscurae, intimae conspicue diluteque marginatae. Bracteae 2—3 subulatae. Pili involucri albidus sat numerosi 2—3 mm longi, pedunculi superne modice breviterque albido-pilosi, caulis disperse v. modice pilosus, folia utrinque breviter molliterque subpilosa, 1—2 mm, in margine petioloque ut in nervo dorsali pilis albidis breviter subvillosa, supra saepe glabrescentia submaculata. Glandulae in involucri subnullae, in pedunculis solitariae. Flocci in involucri modice numerosi, pedunculi albido-cani, caulis superne multifloccosus, folia in nervo dorsali \pm floccosa. Flores saturate lutei, ligulae apice subglabrae; stylus luteus. Achaenia atra.

Crescit in alpibus calcareis Italiae: m. Pollino 19—2000 m, praecipue in cavis rupium ad Polinello (Rigo).

Exsiccata: Rigo, iter ital. V (1898) no. 393!

Tab. 44, Fig. C. 7—8. *H. incisum* Hoppe ssp. *tephrochlorum* Zahn (e loc. class.). 7. Squama. 8. Pedunculus sub involucri.

29. Hieracium subspeciosum Naeg. in litt., apud N. P., Hierac. Mitteleuropas II p. 147 (1886); Prantl, Fl. v. Bayern (1884) p. 534; *H. speciosum* Koch, Syn. ed. 2 II p. 518 pp.; Fries, Epicr. (1862) p. 66 pp.; Gren. Godr., Fl. France II (1850) p. 359; non Hornem. nec Reichb. f., Ic. XIX tab. 205 f. 2.

Dispositio gregum:

- a. Folia caulina pauca cito decresecentia, inflorescentia squarrosa.
- a. Patulum N. P. II p. 149. Habitus *H. silvatici*, involucrum *H. villosi*.
- b. *Oxyodon* Zahn, in Koch Syn. (1901) p. 1803; *Pseudorupestre* N. P. l. c. Habitus et involucrum ut in *H. glauco*.

- b. Folia caulina complura \pm sensim decrescentia, inflorescentia multo minus squarrosa.
- c. *Glaucopsis* N. P. I c. Habitus *H. bupleuroidis*, involucrium *H. glauci*; planta basin versus conspicue dense pilosa.
- d. *Crinisquamum* N. P. I c. Habitus *H. villosi*, involucro *H. villosiceps imitans*; planta utrimque fere aequaliter pilosa.
- e. *Subspeciosum* N. P. I c. Habitus *H. dentati* v. *H. glauci*, sed fere *epilosum*, involucrium *H. glabrati* v. *dentati*; planta basin versus non longius pilosa.
- a. *Patulum*.

Subspecies patulum N. P. II p. 151. Caulis ad 32 cm altus gracilis striatus erectus phyllopodus. Folia rosularia numerosa petiolata lanceolata denticulata v. grosse dentata acuta mucronata; caulina c. 4 cito decrescentia lanceolata basin versus attenuata, summum fere lineare; omnia glauca rigidiuscula. Inflorescentia furcata indeterminata 2—5 (—10) cephalae; acladium 4—10 cm longum; rami primarii 1—3 (—5) valde remoti graciles oblique erecti monocephali v. simpliciter ramosi. Involucrium 11—22 mm longum ovatum demum \pm globosum; squamae latiusculae lanceolatae longe acuminatae acutissimae obscurae canofloccosae. Bractae c. 3 subulatae. Pili in involucro sat densi diluti 1,5 mm longi, caulomata utrimque disperse pilosa (1,5—2,5 mm), folia supra glabra v. fere glabra, subtus \pm disperse molliterque pilosa (2—3 mm), petiolus subpilosus. Glandulae nullae v. solitariae. Involucrium subcanofloccosum, pedunculi cani, caulis usque ad basin plurifloccosus, folia effloccosa. Flores dilute flavi, ligulae glabrae; stylus fuscescens. Achaenia brunea 3—3,3 mm longa.

Crescit in alpinis calcareis Tiroliae: Neuprags (Naeg.); Carinthiae: Alpe Selenitza (Jabornegg), Predil (Huter), Wischbergalpe (v. Benz); Stiriae: Zeyritzcampel p. Kalwang (Correns, Khek, primo pro *H. Arolae* Murr habitum); Helvetiae: Grosser Mythen (Bamberger), Château-d'Oex (Leresche), Solalex (Favrat).

Variat: $\betapseudosixtinum Zahn; *H. sixtinum* A.-T. in herb. Chenevard. Folia tenuia subglauescentia acute serrato-dentata, exteriora minora oblongo-lanceolata obtusa, caulina saepe sensim decrescentia. — Helvetia: Colla supra Fusio (Chenevard, Zahn). Solalex-Anzeindaz (Zahn).$

Tab. 45, Fig. A 1—2. *H. subspeciosum* Naeg. ssp. *patulum* N. P. β *pseudosixtinum* Zahn (inter Colla et Fusio, leg. ipse). 1. Squama. 2. Pedunculus sub involucro.

Subspecies dolichocephalum N. P. II 152; *H. Jaborneggi* Pacher, in Pacher et Jaborn., Fl. Kärnth. I 2 p. 179 (1882). Caulis ad 32 cm altus gracilis parum flexuosus substriatus erectus phyllopodus. Folia rosularia complura breviter petiolata lanceolata acutissima denticulata; caulina 2—4 saepissime cito decrescentia inconspicua lanceolata; omnia glauca rigidiuscula. Inflorescentia monocephala v. furcata indeterminata 1—3 (—6) cephalae; acladium 3,5—8 cm longum; rami primarii 0—2 (—3) graciles monocephali. Involucrium 14—16 mm longum ovatum demum fere globosum; squamae satis angustae lineares longe acuminatae acutissimae atrovirides, extimae sublaevae, bractae 4—5 subulatae. Pili involucri densi diluti (1,5—2 mm), pedunculi subpilosi v. fere epilosus, caulis basin versus tantum subpilosus, rarius totus caulis subpilosus, 1—3 mm, folia supra glabra v. marginem versus disperse pilosa, subtus parcepilosa, in margine nervoque dorsali modice pilosa, 1,5—3 mm. Glandulae nullae, versus apicem squamarum rarissimae. Flocci involucri marginem squamarum versus mediocriter numerosi, pedunculi superne subcanotomentosi, inferne cito deminuti usque ad medium caulem descendentes. Flores lutei, ligulae glabrae; stylus luteus. Achaenia castanea v. atra, 3,5 mm longa.

Crescit in alpinis calcareis inter 800—1600 m; Helvetia: Nessli pr. Reidenbach in valle Simmental (Maurer); Butino in v. Camadra (Keller), Compietto-Olivone (Keller), inter Hinterrhein et Spluegen (Felix), supra Spluegen versus Stutzalpen (Naeg., Zahn), Safiental (Bruegger), Val Luzzone: All Sasso-Rifuggio, Cuolm p. Vanescha, Alpe Blengias p. Lumbrein, inter Safien et Glas (Steiger), „Schwarzwald“ pr. Jochalpe supra Churwalden (Bruegger), Samnaum (Muret, Kaeser), Alpe Choeglias iuxta Fimberpass (Bruegger); Tschingla in m. Walenstadterberg (Schinz), Appenzell versus Kamor 812 m (Naeg.), in m. Buetschli (Heer), in v. Seealp m. Saentis (Vetter), in m. Glaernisch (Heer); Algoviae: untere Seealp p. Oberstdorf (Schnizlein); Tiroliae: inter Hochfinsternmünz et Nauders (N. P.); Carinthiae: Bärental in montibus Karawanken (Jab., Benz).

Exsiccata: Hieracia Naegelianae no. 358, 359.

Tab. 45, Fig. B. 3. *H. subspeciosum* Naeg. ssp. *dolichocephalum* N. P. (e alpinis Stutzalpen supra p. Spluegen, leg. ipse). 3. Squama.

b. Oxyodon.

Exsiccata: Fries, Hier. europ. exs. no. 36; Doerfler, Herb. norm. cent. XXXI no. 3132 (sub nom. H. callianthum A.-T., leg. J. Murr).

Tab. 49, Fig. A. 1—3. *H. subspeciosum* Naeg. ssp. *comolepium* N. P. α) *genuinum*

1) *normale* Zahn (e monte Hoettinger Alpe p. Innsbruck, leg. J. Murr). 1. Apex ligularum. 2. Squama. 3. Pedunculus sub involucri.

Subspecies **melanophaeum** N. P., Hier. Mittel-Europ. II p. 159; nec J. Murr, in Doerfler, herb. norm. cent. XXXI no. 3133. — Caulis ad 27 cm altus gracilis strictus v. paulum flexuosus striatu sphyllipodus. Folia rosularia 3—5 breviter petiolata v. basin versus tantum ± attenuata lanceolata acuta dentata v. denticulata, exteriora saepe acutiuscula mucronata; caulina 3—4 subsensim decrescentia sessilia basi attenuata v. (praecipue superiora) rotundata lanceolata denticulata; omnia glaucescentia mollia. Inflorescentia monocephala v. furcata indeterminata 2—3 cephalae; acladium 9—13 cm longum; rami primarii 0—2 valde remoti subgraciles suberecti monocephali. Involucri 14—17 mm longum globosum; squamae latiusculae anguste lanceolatae longe acuminatae acutissimae nigro-virides. Bractae 3—4 lineares. Pili involucri densi diluti 2—3 mm longi, caulomata superne pilis dilutis basi atris mollibus sat numerosis inferne subdeminutis basin versus numerosioribus 1,5—3 mm longis oblecta, folia utrimque subpilosa, in margine et in nervo dorsali densius pilosa (pili 3—4 mm longi). Glandulae nullae, apicem squamarum versus sparsae. Flocci involucri subnulli, in squamarum margine sparsi, caulomata superne subcanotomentosa, usque ad medium subfloccosa. Flores saturate lutei, ligulae apice glabrae; stylus obscurus; achaenia dilute brunea 3 mm l.

Crescit in alp. calc. Helvetiae, Tiroliae, Austriae inferioris. — Flor. Jul.-Aug.

Variat: 1) normale N. P. l. c. — Helvetia: In m. Kalkberg supra Spluegen 1950—2200 m (Naegeli); Tirolia: Vennertal iuxta iugum Brenner 1950—2110 m (Naeg.); Austria inferior: Dürrenstein (N. P.)

2) calvius N. P. l. c. p. 160. Folia caulina 4—6 subsensim decrescentia. Caulis ad 35 cm altus, acladium 4—8 cm longum. Involucrum 12—15 mm longum. Folia interdum supra fere pilosa, pili in caule basin versus ad 6 mm longi. Squamae magis lanceolatae, achaenia dilute rufo-brunea breviora. — Helvetia: Infra Kaltwassergletscher iuxta iugum Simplon 1885—2275 m (Naegeli), Kalkberg supra p. Spluegen.

Exsiccata: Hieracia Naegeliana no. 363 (normale).

Tab. 49, Fig. B. 4—6. *H. subspeciosum* Naeg. ssp. *melanophaeum* N. P. 1) normale N. P. (e m. Kalkberg supra pagum Spluegen, leg. ipse). 4. Squama. 5. Pedunculus sub involucro. 6. Folium caulinum, portio e parte aversa.

Subspecies **pseudoplantagineum** Zahn, in Schinz et Keller, Flora d. Schweiz ed. 2 II (1905) p. 297; *H. plantagineum* Arv.-T., apud Briquet, Notes crit., Bull. Soc. Murith. XXVIII (1900) p. 70; nec Arv.-T., Hier. alp. franç. (1888) p. 31; *H. Seringeanum* Arv.-T., in Wilczek, Notes Hierac., Bull. Soc. Murith. XXXI (1902) p. 102; non Zahn, in Koch Syn. (1901) p. 1899. — Caulis 10—40 cm altus gracilis saepe subflexuosus substriatus sparsim breviterque pilosus usque infra medium subfloccosus. Folia rosularia late lanceolata saepe longa ± longe petiolata, in petiolum longe attenuata glauca, in margine nervoque dorsali tantum sparsim pilosa, denticulata v. ± irregulariter grosse dentata mollia; caulina 3—4 lanceolata, in nervo dorsali saepissime subfloccosa. Inflorescentia laxa paniculata; acladium 1—2 cm longum, rami primarii (1—) 2—4 (—5) oblique erecti saepe simpliciter ramulosi, capitula (1—) 3—7 (—15). Involucrum 11—13 mm longum ovatum fere mediocriter breviterque pilosa, squamae angustae acutiusculae v. acutae, in marginibus sat dense floccosae v. leviter tomentosae, fere omnino eglandulosae. Pedunculi albidotomentosi eglandulosi pilosi. Ligulae saturate luteae apice glabrae; stylus obscurus; achaenia obscure brunea 3,8 mm longa.

Crescit in alpinis calc. Sabaud-Helvicis inter 1600—2050 m: Haut de Taney, Pic de Linleux, Cornettes de Bise, Col de Vernaz, Lac d'Ervin (Briquet); supra „zum Stein“ pr. Grindelwald (Bernoulli), in alpinis supra Bex: Lavaraz (Zahn). — Flor. Jul., Aug.

H. dentato ssp. *Ormontense* valde affine et verosimiliter = *villosum* < *bifidum* v. *dentatum-bifidum*.

Tab. 50, Fig. A. 1—4. *H. subspeciosum* Naeg. ssp. *pseudoplantagineum* Zahn (inter Les Echelles et alpem Haut de Taney 1700 m, leg. ipse). 1. Squama. 2. Pedunculus sub involucro. 3. Nervus dorsalis folii tertii caulini. 4. Achaenium.

Subspecies **calcicola** N. P. II p. 160; *H. inclinatum* b) *subspeciosum* Arv.-T., Hier. alp. fr. (1888) p. 22. — Caulis 4—6 dm altus gracilis subflexuosus strictus phyllopodus. Folia rosularia 3—5 longe petiolata, exteriora ± oblonga obtusa, reliqua lanceolata in petiolum longe attenuata acuta v. acutissima fere integerrima v. denticulata aut dentata v. grosse dentata; caulina 2—3 (—4) radicalibus conformia, subsensim v. cito decrescentia; omnia glaucescentia sat mollia. Inflorescentia altifurcata ± determinata (1—) 2—5 cephalae; acladium (1—) 3—6 cm longum, rami primarii (0—) 1—3 remoti graciles suboblique erecti, monocephali rarius simpliciter ramulosi. Involucrum 11—13 mm longum ovatum demum fere

globosum; squamae latiusculae lanceolatae sursum cito acuminatae acutiusculae v. acutae obscurae (nigro-virides) angustissime diluteque marginatae, exteriores sublaxae. Bractee 3—4 sub involucre confertae subulatae. Pili involucri sat numerosi diluti 1,5—2 mm longi, caulomata utrimque subpilosa (1,5—5 mm), folia supra epilosa v. apicem versus tantum disperse sparsimve pilosa, subtus disperse v. modice pilosa, in margine nervoque dorsali sat dense molliterque pilosa (3—5 mm). Glandulae involucri dispersae, in pedunculis superne sparsae, in reliqua planta nullae. Flocci involucri nulli, in marginibus squamarum tantum modice numerosi, pedunculi superne dense floccosi v. subcanotomentosi, caulis usque ad medium subfloccosus, folia effloccosa. Flores subdilute lutei, ligulae apice glabrae; stylus obscurus; achaenia dilute brunea 3,5 mm longa. — Flor. Jul.-Aug.

Variat: 1) normale Zahn. — Helvetia: In monte Kalkberg supra pagum Splügen 1950—2200 m (Naegeli), in m. Montalin 2000 m supra pagum Maladers p. Curiam (Jaccard, Braun).

2) pilosum Zahn. — Folia utrimque subpilosa, involucre subfloccosum. — Kalkberg p. Splügen (id.), p. Sils in v. Engadin (id.).

Exsiccata: Hierac. Naegel. no. 364 et 365 (planta culta).

Tab. 50, Fig. B. 5—8. *H. subspeciosum* Naeg. ssp. *calcicola* N. P. 1) normale Zahn (e m. Kalkberg supra Splügen, leg. ipse). 5. Squama. 6. Pedunculi portio. 7. Nervus dorsalis fol. secundi caulini. 8. Ligula.

30. Hieracium politum Fries, Symbolae (1848) p. 84; Epicrisis (1862) p. 73 (excl. loc. Algov.); Gren. Godr., Fl. de France II (1850) p. 355; Reichb., Comp. (1860) tab. 211, fig. 2; *H. glaucum* Vill., Hist. pl. Dauph. III (1789) p. 116; non All.; *H. glaucum* var. Fries, Epicr. p. 69; *H. Grenierianum* Arv.-Touv., Essai (1873) p. 50 pp.; *H. Arveti* Verlot, Catal. grains Jard. bot. Grenoble (1879) p. 12; Arv.-T., Hierac. alp. franç. (1888) p. 20; Zahn, in Koch Syn. (1901) p. 1805; = **subspeciosum-glaucum** (v. **-bupleuroides**) Zahn, in Koch Syn. l. c. — Certissime cl. Friesius in Symbolis (1848) p. 84 et in Epicrisi p. 73 sub nomine *H. politum* descripsit *H. glaucum* Vill. verum, sed exemplar scilicet cultum respiciens hypophyllopodum „rosulas edens, sed sub anthesin aphylllopodum“ dicit. Post Friesium nomen „*politum*“ etiam a cl. Grenierio in Godr. Gren., Fl. de France (1850) II p. 355, ad *H. glaucum* Vill. relatum est. Planta spontanea Grenieriana a cl. Friesio demum visa, in Epicrisi p. 69 pro *H. glauco* inducitur. Sed ex differentia habitus et staturae, quae necessario existit inter plantam hortensem per multos annos cultam et plantam spontaneam, facile intelligitur, cur cl. Friesius plantam spontaneam et cultam postremo seiunxerit.

Habitus ut in *H. glauco*. Caules et folia saepe subviolacea. Caulis 20—50 cm altus gracilis subtiliter striatus pilosus. Folia radicalia numerosa petiolata v. breviter petiolata v. basin versus attenuata, exteriora obovata-spathulata apice rotundata, pleraque oblongo-lanceolata v. lanceolata acuta, interiora saepe anguste lanceolata, remote denticulata v. subdentata, in nervo dorsali basin versus petioloque sparsim breviterque pilosa, interdum etiam in margine sparsim ciliata aut minus sparse pilosa; caulina 3—5 lanceolata v. angustiora subsensim decrescentia, inferiora basi attenuata subpetiolata, summa linearia sessilia; omnia rigida glauca, interdum in parte superiore submaculata. Inflorescentia saepe subindeterminata subsquarrosa furcata 2—3 (—8) cephalia, aeladium (2—) 3—6 (—9) cm longum, rami primarii subremoti arcuato-ascendentes 1 (—2) cephalia. Involucre 11—14 mm longum globosum demum truncatum v. depressum. Squamae sublatiusculae obtusae, interiores acutiusculae v.

acutae, atrovirides dilutius viridi-marginatae, epilosae disperse v. subdense floccosae, in margine saepius densius floccosae, eglandulosae v. glandulis sparsis praeditae; pedunculi epilosii apice tantum subfloccosi et glandulis fere nullis v. solitariis obsiti. Bractee 4—6 sub involucrio confertae subulatae. Flores satis dilute flavi, stylus fuscescens demum obscurus; achaenia nigro-brunea.

Crescit in consortio *H. subspeciosi* et *H. glauci* v. *H. bupleuroidis* in alpibus Delphinatus et Austriae. — Fl. Jul.-Aug.

Subspecies **Arveti** Verl. l. c.; *H. Arveti* α) *genuinum* Zahn, in Koch Syn. l. c. Inter *H. subspeciosum* ssp. *chondrilloides* Vill. et *H. glaucum* All. quasi intermedia. Involucrum dense floccosum \pm farinaceum, interdum (ut etiam pedunculi sub involucrio) glandulis nonnullis adpersum. Folia angustiora subpetiolata vulgo haud maculata.

In alpibus calc. Delphinatus: Mt. Séuse p. Gap (A.-T.), de la Chapelle en Valgaudemard aux Clots aux bords de la Sèveresse (id.), sous les Rochers des Trois-Puëlles à St. Nizier près Grenoble (A.-T.); Villard-de-Lens; Briançon etc. (A.-T.)

Exsiccata: Magnier, Fl. select. 2774!; Soc. dauph. 2^e série (1890) no. 138!; Arv.-T. et Gaut., Hieracioth. gall. no. 126, 126^{bis}, 126^{ter}!!!

Tab. 51, Fig. A. 1—3. *H. politum* Fr. ssp. *Arveti* Verl. (Mt. Séuse p. Gap, leg. A.-T.). 1. Squama exterior. 2. Squama interior. 3. Pedunculus sub involucrio.

Subspecies **subisaricum** M. et Z.: *H. Arveti* β) *subisaricum* M. et Z., in Koch Syn. (1901) p. 1805. (Cfr. Murr, in Oesterr. bot. Zeitschr. 1893 p. 179, anno 1895 p. 393, ibidem 1902 p. 390). Inter *subspeciosum* ssp. *subspeciosum* Naeg. et *H. glaucum* quasi intermedia, secundum Murrium forsitan *bupleuroides* > *silvaticum* (s. *incisum*), sed verosimiliter *bupleuroides* \rightarrow *bifidum*. Ut icones docent, *H. subisaricum* et *H. Arveti* valde affinia sunt, et meo sensu sub una specie comprehendenda. Involucrum multo minus floccosum. Folia paulo latiora longius petiolata subcrassa valde nitentia et vere polita saepe subintegerrima saturatius viridia vulgo purpureo-maculata aut perfusa. Glandulae saepissime nullae.

Tirolia: In glareolis calc. valleculae „Isstal“ in m. Salzberg prope Hall 1650 m et in v. Hinterautal (Murr). Stiria: in m. Zeyritzkampel p. Kalwang (Correns).

Exsiccata: Doerfl., Herb. norm. 3151!

Tab. 51, Fig. B. 4—10. *H. politum* Fr. ssp. *subisaricum* M. et Z. (e m. Salzberg, leg. Murr). 4. Ligula. 5. Squama exterior. 6. Squama interior. 7. Pedunculus sub involucrio. 8. Achaenium. 9. Pilus pappi. 10. Pilus stellatus.

33. Hieracium cirritum Arv.-T. = **silvaticum** > **glanduliferum**; Arv.-T., Monogr. (1873) p. 27; Hier. alp. fr. p. 76; N. P. II p. 260 pp. — Inter *silvaticum* et *glanduliferum*, sed *H. silvaticum* magis simile, habitu *H. incisum*. Caulis 20—35 (—50) cm altus tenuis v. gracilis subflexuosus subtiliter striatus apicem versus ramosus phyllopodus. Folia rosularia 3—6 distincte v. longe petiolata, ovata elliptica oblonga v. oblongo-lanceolata et lanceolata, obtusa v. acuta, basi truncata interdum ± cordata v. rotundata v. cito sensimve in petiolum angustata, denticulata v. dentata v. ± serrato-dentata saepe grosse v. profunde dentata v. pinnatifida, dilute viridia v. subglaucescentia mollia v. subrigidiuscula, eglandulosa utrinque dense v. tantum ± modice pilosa (1—3 mm); caulinum 0—1 (—2) saepissime parvum interdum in nervo dorsali subfloccosum. Inflorescentia laxa paniculata v. altefurcata; acladium 0,5—5 cm longum; rami primarii (1—) 2—5 (v. plures), superiores saepe paulum remoti, simpliciter ramulosi v. monocephali, capitula 2—6 (—12). Involucrium (9—) 10—12 (—14) mm longum primo ovatum demum ± globosum; squamae angustae acutissimae nigrae interdum anguste diluteque marginatae dense pilosae (1—1,5 mm) v. fere epilosae mediocriter glandulosae. Pedunculi superne dense glandulosi ± subpilosi, caulis demum glandulosus, infra medium saepissime eglandulosus. Flocci in involucrio nulli v. densissimi, caulomata superne ± dense floccosa saepe usque ad basin subfloccosa. Bractee 2—3 minutae. Flores ± lutei saepissime lingulati, stylus ± obscurus; achaenia atra 3—3,5 mm longa.

Hab. in alpeis elatioribus. Flor. Jul.-Aug.

H. cirritum A.-T. complectitur (ad interim) etiam *H. bifidum* > *glanduliferum*.

Dispositio gregum:

- a. *Hypochoerideum* Zahn. Involucrium magnum 12—14 mm longum denique ventricosoglobosum depressum.
- b. *Cirritum* Zahn. Involucrium 10—13 mm longum mediocre v. sat parvum (more *H. silvatici*) ovatum denique saepissime latius depressum.
 - a. *Hypochoerideum* Zahn.

Subspecies **hypochoerideum** Arv.-T., Suppl. à Monogr. (1876) p. 16; Hier. alp. fr. p. 74; *H. virgulatum* A.-T. l. c. — Caulis (10—) 20—35 (—50) cm altus gracilis v. crassiusculus saepe subascendens utrinque mediocriter v. sat dense pilosus (2—3 mm) et ± floccosus. Folia rosularia c. 6 petiolata fere ovata et ovata-lanceolata v. oblonga et oblongo-lanceolata, saepe fere triangularia, obtusa v. brevius longius acuminata basi abrupte sensimve in petiolum angustata, denticulata v. grosse dentata v. basin versus profunde sinuato-dentata, utrinque modice v. inferne magis pilosa, in margine dense pilosa, in nervo dorsali petioloque albopilosa (1—5 mm); caulinum 0—1 (—2) lanceolatum v. lineare; omnia lutescenti- v. sordide viridia subglaucescentia eglandulosa. Acladium 5—45 mm longum, rami primarii 0—2 (—3) remoti saepissime 1—2 cephalii. Squamae angustae acutissimae subnigrae sat dense pilosae (1—2 mm) fere eglandulosae parcae v. sat dense floccosae. Pedunculi sat dense pilosi canofloccosi sparsim mediocriterve glandulosi. Flores lingulati, stylus obscurus.

Variat: 1) **normale** Zahn.

- a) **verum** Zahn. Involucrum parcefloccosum fere eglandulosum, pilis subdensis dilutis basi atris obtectum. — Delphinatus: Mte Viso (A.-T.); Helvetia: Les Outans, Lavaraz, Anzeindaz, Paneyrossaz (Chenevard), La Tornettaz (Wagner), in alpe Rosswald iuxta iugum Simplon (Favrat) et versus Kaltwassergletscher (Favre), Binn (Favrat), Egimental et Kuhmattalpe (Lagger), Rhône-gletscher, Naretpass (Zahn), Val Piora versus m. Caulis 30—55 cm altus crassiusculus v. crassus erectus strictus v. subflexuosus striatus, phyllopodus v. hypophyllopodus, in planta culta interdum aphyllopodus. Folia rosularia pauca sat magna, (saepe longe) petiolata, oblonga v. elliptica, obtusa acutave, remote denticulata v. saepissime grosse dentata, dentibus patentibus v. antrorsum versis, saturate viridia v. subglaucescentia et dilutiora mollia; caulina (3—) 5—8 (—12), infima subpetiolata radicalibus similia, media latiora ovata v. elliptica v. fere rhombiformia sessilia basi saepissime angustata. Inflorescentia alte furcata v. laxe paniculata indeterminata 3—10 cephala; acladium (1—) 2—7 (—9) cm longum; rami primarii 2—5 crassiusculi v. graciles suberecti v. oblique erecti; ordines axium 2—3. Involucrum 11—15 mm longum ± globosum denique saepe subdepressum; squamae angustae, interdum latiusculae, lineares, longe acuminatae acutissimae, obscurae ± dilute marginatae, exteriores laxae. Bracteae (1—) 3—4 subulatae. Pili in involuero modice numerosi v. densi diluti 1—3 mm longi, caulomata saepe paulo minus

pilosa, pilis mollibus 2—4 mm longis, subtus semper densioribus longioribusque obsita. Glandulae minutae, in involucrio sparsae v. mediocriter numerosae, in pedunculis saepe solitariae. Flocci involucri fere nulli v. mediocriter numerosi, caulomata superne tomentosa, inferne saepe usque ad caulis basin deminute floccosa, folia caulina in nervo dorsali interdum subfloccosa. Flores dilute saturateve lutei, ligulae apice glabrae v. breviter subciliatae; stylus ± obscurus; achaenia brunnea rarius atra, 3—3,6 mm longa.

Hab. Helvetia, Tirolia (in iugo Brenner et pr. Bozen tantum inventum), Stiria. — Flor. Jul., Aug.

Formae rarissimae, inter *H. villosum* et *H. vulgatum* intermediae, paucis locis tantum observatae et verosimiliter origine hybrida. A cl. Naegeli et Peter l. c. 5 subspecies descriptae sunt, de quibus 3 tantum e locis naturalibus. Addimus praeterea subspeciem novam a cl. Oborny detectam:

Subspecies **Zahnii** Oborny, Oesterr. bot. Zeitschr. (1902) no. 7; *H. gothicum* > *alpinum* Oborny et Zahn l. c. Rhizoma crassiusculum obliquum. Caulis phyllopodus rigidus subflexuosus viridis saepe purpureo-coloratus v. maculatus subglaber 25—40 cm altus. Folia rosularia 3—5 in petiolum sensim attenuata, exteriora fere obovata apice rotundata, reliqua ovato-lanceolata acuminata pariter ac caulina rigida saturate viridia glaucescentia. Folia caulina 3—5 sensim decrescentia, infimum radicalibus interioribus simile, subpetiolatum, reliqua late lanceolata acuta basi contracta subsemiamplexicaulia, summa angustiora saepe bracteiformia, in margine ut etiam radicalia dentibus angustis acutis denticulata v. subdentata, omnia supra sparsim breviterque pilosa, in margine et in nervo dorsali pilis albis ± densis obsita. Inflorescentia 1—5 (—8) cephalae laxae paniculatae subindeterminatae, acladium 10—25 (—40) mm longum. Involucrum ovatum basi denique truncatum; squamae e basi latiore acuminatae obtusiusculae v. acutiusculae, regulariter imbricatae, extimae sublaevae et in bracteis decrescentes, omnes subatrae late viridi-marginatae sat dense obscureque pilosae, 2—2,5 mm, parcefloccosae et glandulis nonnullis minutis praeditae. Pedunculi pilis sat densis apice subdilutis basi atris et glandulis solitariis muniti, apice canotomentosi. Bractee 3—5 sat parvae. Flores saturate lutei, ligulae apice saepissime glabrae, stylus fuscus, achaenia nigro-brunnea.

Hab. in alpe Frauenalpe pr. Murau Stiriae superioris (Oborny, Fest).

Verosimiliter initio hybridum inter *H. vulgatum* et *H. villosum* ssp. villosissimum N. P.

Tab. 75. *H. ctenodon* N. P. ssp. *Zahnii* Oborny (e loco class., leg. A. Oborny).

1. Squama interior.
2. Squama exterior.
3. Pedunculus sub involucrio.
4. Apex ligularum.
5. Pars aversa folii caulini.
6. Margo foliorum.
7. Achaenium.

46. Hieracium Benzianum Murr et Zahn, in Schinz et Kell., Fl. d. Schweiz ed. 2 II (1905) p. 304; in Koch Syn. (1901) p. 1821; = **vulgatum-silvaticum-villosum** Zahn; *H. vulgatum* > *villosum* Zahn, in Koch Syn. l. c., *H. vulgatum-silvaticum-villosum*, *H. vulgatum-incisum* Zahn l. c.; *H. ctenodontoides* Zahn l. c.; *H. Ausserdorferi* Zahn l. c., nec Hausmann, nec Kerner in sched.!

Ne unus error plures pariat errores ad synonymiam *H. Benziani* hoc addo:

1. Initio, in Koch Syn. (1901) p. 1821, *H. Benzianum vulgatum* > *villosum* putavi, sed ex exemplaribus numerosioribus a cl. de Benz nuper collectis *H. Benzianum* nunc speciem intermediam inter *H. vulgatum* et *incisum* (Trachselianum) habere cogor.

2. In tali interpretatione nomen *H. Benzianum* ad *H. Ausserdorferi* synonyma pertineret.
3. At *H. Ausserdorferi* Hausm. in litt. ad Ausserd. 1866, a me in herbario Huteriano visum et in Kochii Syn. (1901) p. 1821 formis speciei intermediae *vulgatum-incisum* adscriptum, quantum nunc quidem iudicare possum, forma est *H. ramosi* W. Kit., habitu omnino *H. vulgati* caule ad 12 foliato. Planta sub nomine *H. Ausserdorferi* a cl. A. Kerner in Flora exs. austro-hungarica no. 3373 edita est subspecies gregis *Maculatum H. vulgati*.
4. Ex his rationibus nunc sine dubio nomen *Benzianum* sensu lato formis attribuere mihi licet, quae formulae *vulgatum-silvaticum-villosum* respondent.
5. *H. Eversianum* A.-T. apud Murr, in Deut. bot. Monatsschr. (1897) p. 282, prioritate quidem gaudet adversus *H. Benzianum*, sed formulam supra dictam minus evidenter effingit; itaque nomen *Benzianum* speciei collectivae, nomen *Eversianum* gregi primo (et subspeciei *Eversianum* huius gregis) reservatum velim.

Caulis tenuis v. gracilis saepe subflexuosus, striatus, saepissime \pm pilosus basin versus densius pilosus, superne subfloccosus eglandulosus, 25—35 (—40) cm altus, phyllopodus. Folia rosularia complura v. interdum pauca \pm longe petiolata, elliptico- v. oblongo-lanceolata saepe sat magna, utrimque attenuata sensim in petiolum angustata, exteriora \pm obtusiuscula v. ut reliqua breviter acuminata acuta mucronata, omnia utrimque dentibus triangularibus acutis v. lanceolatis antrorsum versis glanduloso-mucronatis subnumerosis saepe varie longis interdum sat grossis munita, sat mollia, subglaucescentia dilute obscureve viridia, supra glabra v. ut subtus sparsim breviterque pilosa, in margine et in nervo dorsali petioloque sat dense pilosa, pilis 1—4 mm longis, v. interdum pilis brevibus sparsis v. dispersis obsita. Folia caulina 2—4 subsensim decrescentia remota, inferius v. etiam scundum subpetiolatum radicalibus simile, usque supra medium grosse dentata, reliqua fere sessilia v. sessilia basi \pm longe cuneata v. breviter contracta, summa saepissime anguste lanceolata v. linearia acutissima, denticulata v. \pm integerrima, interdum in nervo dorsali subfloccosa. Inflorescentia laxa paniculata v. \pm alte furcata, aeladium 10—50 (—100) mm longum (rarissime longius), rami primarii 1—3 (—4) \pm remoti suberecti v. oblique erecti, ordines axium 3, capitula 3—7 (—12). Involucrum ad 13 (—15) mm longum ovatum, squamae angustae acutissimae v. latiores \pm longe acuminatae acutae interiores acutissimae v. interdum exteriores acutiusculae, omnes obscurae v. obscure virides, haud raro (praecipue interiores) \pm viridi-marginatae, fere semper sparsim floccosae dense mediocriterve pilosae, pilis 1—2,5 mm longis apice dilutis v. subobscuris basi atris, fere eglandulosae v. glandulis solitariis sparsisve munitae. Pedunculi tenues v. graciles saepissime stricti, sat dense sparsimve pilosi, fere eglandulosi v. subglandulosi, saepissime albido- v. canotomentosi. Bractee 1—4 minutae. Flores lutei v. saturate lutei, interdum subaureoltei, ligulae apice fere semper glabrae, stylus vulgo obscurus, achaenia subatra.

Hab. in ditione *H. villosi*, *dentati* et *incisi*, in Helvetia, Tirolia, Carinthia et Stiria. — Flor. Jul., Aug.

Habitus ut in *H. diviso* Jord. (= *vulgatum-silvaticum*) v. ut in *H. caesio* Fr. (= *vulgatum-silvaticum-glaucum*), sed differt squamis longe acuminatis acutis v. acutissimis \pm dense v. mediocriter pilosis fere eglandulosis; a *H. bifido* praecipue differt foliis caulinis 2—4 subsensim decrescentibus, a *H. psammogene* differt iisdem characteribus et involucris parum

floccosis, nec dense stellatis. Grex *Vulgatifolium* transitum inter *H. Benzianum* et *H. caesii* gregem *Davallianum* sistere videtur.

Dispositio gregum:

- a. *Eversianum* Zahn. Acladium 4—9 (—15) cm longum, involucria maiora 13—15 mm longa, pariter ac caulomata densius longiusque pilosa. Formulae Murrianum-vulgatum respondens.
 - b. *Benzianum* Zahn. Acladium 1—3 (—5) cm longum, involucria 10—13 mm longa, pariter ac caulomata pilis brevibus sat densis v. mediocriter numerosis obsita, eglandulosa v. glandulis nonnullis praedita. Formulae Trachselianum-vulgatum respondens.
 - c. *Vulgatifolium* Zahn. Habitus *H. vulgati*. Acladium 1—3 cm longum, involucria 10—12 mm longa breviter subpilosa sparsim mediocriterve glandulosa, caulomata sparsim pilosa superne (pedunculi) mediocriter glandulosa. Formulae incisum-vulgatum respondens.
- a. *Eversianum* Zahn.

Subspecies *Eversianum* A.-T., in litt ad J. Murr (1895) et apud Murr, in Deut. bot. Monatsschr. (1897) p. 282; Zahn, in Koch Syn. (1901) p. 1798; *H. incisum* ssp. *Hittense-vulgatum* ssp. *lonchodes*. Caulis 30—40 cm altus, inferne sat dense pilosus, superne subpilosus subfloccosus, apice hinc inde glandulis solitariis praeditus. Folia rosularia sat magna, exteriora minora ovata aut florendi tempore emarcida, reliqua late ovato-lanceolata v. oblongo-lanceolata \pm sensim in petiolum angustata subacuminata acuta, remote irregulariterque et saepe grosse acuteque dentata, caulina 1—2 (—3) late lanceolata v. lanceolata, inferius radicalibus saepissime simile, reliqua acutiora fere subpetiolata serrato-dentata, summum saepe elongatum bracteiforme, omnia supra brevissime disperseque pilosa v. glabrescentia, subtus subpilosa, in nervo dorsali et in petiolo sat longe subvillosa, in margine sat dense ciliata, subglaucescentia vel plerumque obscure viridia, summa in nervo dorsali saepe subfloccosa. Inflorescentia alte furcata 1—7 cephalia, acladium 4—9 (—15) cm longum, rami primarii 1—2 valde remoti 1—2 (—4) cephalia, involucrum 13—15 mm longum globoso-ovatum, squamae saepe subangustae longe acuminatae \pm acutae obscurae v. atrovirides dilutius marginatae, sat dense obscureque pilosae, 1,5—2,5 mm, disperse mediocriterve glandulosae et praesertim in margine subfloccosae. Pedunculi mediocriter glandulosi et pilosi, pilis obscuris 2—3 mm longis, obscure canotomentosi. Flores aureolutei conspicui, ligulae apice saepe distincte subciliatae, stylus obscurus.

Habitus *H. divisi*, characteres ut in *H. Hittensi* Murr; etiam formis quibusdam *H. atrati* haud dissimile. In iugo Arlberg prope Stuben (Evers 1883).

Tab. 76, *H. Benzianum* M. Z. ssp. *Eversianum* A.-T. (e Stuben sub iugo Arlberg, leg. J. Murr). 1. Squama exterior. 2. Squama interior. 3. Pedunculus sub involucrio. 4. Dentes ligularum.

Huc pertinet etiam *H. ctenodontoides* Zahn, in Koch Syn. (1901) p. 1821. Habitus *H. dentati*, capitula minora, dense pilosa, pariter ac pedunculi sparsim glandulosa, folia ut in *H. dentato* v. paulo maiora \pm grosse dentata, caulina 2—5 basi angustata, more *H. vulgati* usque supra medium dentibus antrorsum versis serratodentata, summa subtus in nervo mediano subfloccosa. — Hab. Helvetia, Tirolia, Carinthia. — Verosimiliter formulae *divisum-villosum* respondens.

b. *Benzianum* Zahn.

Subspecies *Benzianum* M. Z.; *H. vulgatum* $>$ *villosum* Zahn l. c. Caulis tenuis disperse albidopilosus. Folia rosularia 2—4 longe petiolata elliptico- v. oblongo-lanceolata denticulata v. breviter serrato-dentata tenuia glaucescentia sublutescenti-viridia, ad summum

in margine, nervo dorsali petioloque sparsim disperse pilosa, caulina 2—4 usque supra medium \pm grosse serrato-dentata, inferius subpetiolatum, reliqua basi breviter contracta v. subrotundata sessilia, summa lanceolata denticulata, in nervo dorsali v. in tota parte aversa \pm floccosa. Inflorescentia \pm altefurcata indeterminata 3—6 (—10) cephalia, acladium ad 3 cm longum, rami primarii 2—3 (—4) tenues \pm stricti 1—2 (—3) cephalia. Involucrum ad 13 mm longum, squamae angustissimae longissime acuminatae acutissimae, sparsim floccosae disperse breviterque pilosae sparsim glandulosae. Pedunculi albidocani, fere eglandulosi, sparsim pilosi. Flores aureolutei, ligulae glabrae.

Carinthia: Prope Raibl (de Benz).

Ob squamas angustissimas valde acutas insigne, *H. incisi* gregi Trachseliano respondens.

Subspecies **ctenodontiforme** Benz et Zahn, in Oesterr. bot. Zeitschr. (1904) no. 7; *H. Trachselianum-vulgatum* l. c. Caulis gracilis disperse basin versus densius pilosus. Folia rosularia c. 4 petiolata oblongo-lanceolata inaequaliter arguteque dentata tenuia subglauca dilute viridia, in margine dense ciliata, in nervo dorsali et in petiolo pilis 1—3 mm longis numerosis obsita, basin versus longe attenuata, dentibus saepe in petiolum descendentibus; caulina 2—4 argute dentata, infima \pm petiolata v. secundum et reliqua basi attenuata sessilia, acuta, summum lineare acutissimum integerrimum. Inflorescentia altefurcata 5—10 cephalia, acladium ad 3 cm longum, rami primarii 2—3 remoti 1—3 cephalia graciles. Involucrum 9—10 mm longum, squamae subangustae acutae, disperse floccosae et pilosae (pilis 1—2 mm longis), eglandulosae, rarissime glandulis valde solitariis praeditae. Pedunculi graciles albido-cani, glandulis solitariis et pilis dispersis brevibus muniti. Flores saturate lutei, ligulae vulgo haud ciliatae.

Carinthia: in iugo Ploekenpass et in alpe Thoerleralpe pr. Raibl (de Benz).

Tab. 77. *H. Benzianum* ssp. *ctenodontiforme* de Benz et Zahn (e Thoerleralpe pr. Raibl, leg. de Benz). 1. Dentes ligularum. 2. Squamae. 3. Pedunculus sub involucrio. c. *Vulgatifolium* Zahn.

Subspecies **inexpertum** M. Z., Oesterr. bot. Zeitschr. (1903) p. 380; *H. Ausserdorferi* ssp. *inexpertum* M. Z. l. c.; *H. Eversianum* < *vulgatum* Murr l. c. Caulis 45—50 cm altus, inferne subpilosus, superne subglaber subfloccosus, gracilis. Folia rosularia 2—4 longe petiolata sat magna ovato-lanceolata irregulariter grosse dentata, dentibus antrorsum versis subnumerosis (more *H. vulgati*), caulina 3—4, inferiora petiolata radicalibus similia, summa basi angustata \pm longe cuneata sparsius breviter dentata v. fere integerrima, omnia subrigidiuscula obscure v. sordide viridia, disperse subrigidiusculeque pilosa, pilis brevibus basi scrobiculis atris insertis, in margine nervoque dorsali et in petiolo subdensius breviterque pilosa, summa subtus in nervo mediano subfloccosa. Inflorescentia laxa paniculata 2—5 (—7) cephalia, acladium 10—25 mm longum, rami primarii c. 3 remoti 1—3 cephalia. Involucrum 10 mm longum ovatum, squamae subangustae acuminatae acutiusculae, nigrovirides late viridi-marginatae, sat dense floccosae subglandulosae mediocriter obscureque pilosae. Pedunculi canotomentosi subglandulosi epilosi v. superne tantum pilis sparsis obsiti. Flores aureolutei, ligulae fere semper glabrae v. sparsim granulatae, stylus fuscus, achaenia subatra.

Hab. in iugo Arlberg prope Stuben (J. Murr).

Transitum sistit inter *H. vulgatifolium* M. Z. (= *Hittense* vel *Eversianum* — *vulgatum*) et *H. vulgatum*, itaque *H. vulgato* valde affine. Subsp. similis sed *H. Eversiano* propior (ssp. *Innsbruckense* Murr in litt.) hoc anno a Murrio supra Hoetting detecta est.

Tab. 78. *H. Benzinum* M. Z. ssp. *inexpertum* M. Z. (e Stuben sub iugo Arlberg, leg. J. Murr). 1. 2. Squamae. 3. Pedunculus sub involucri. 4. Dentes ligularum. 5. Achaenium.

47. Hieracium saxifragum Fries, Symb. (1848) p. 100; Epicr. (1862) p. 87; Herb. norm. fasc. XII no. 17; Dahlst., Bidrag sydöstra Sverig. Hierac.-Fl. III, in Kongl. svensk. Vet.-Akad. Handl. vol. 26 no. 3 (1894) p. 198; Zahn, in Koch Syn. (1901) p. 1822; = **vulgatum-Schmidtii** Zahn, in Schinz et Kell., Fl. d. Schweiz (1905) II p. 305. — Habitus *H. vulgati*. Caulis 20—60 cm altus striatus, saepe ± ascendens interdum subflexuosus, rigidus, inferne breviter (1—3 mm) sparsimque vel sat dense aut dense pilosus, superne minus pilosus vel subglaber et sparsim v. mediocriter floccosus, saepe iam a basi v. altius ± squarrosus et interdum longe ramosus. Folia rosularia pauca, exteriora minora ± elliptica v. obovata obtusa, interiora lanceolata v. + anguste lanceolata acuta, intima interdum lineari-lanceolata cuspidata, omnia saepissime in petiolum saepe late alatum sensim attenuata, integerrima v. rare et minute denticulata rarius dentata v. serrato-dentata, rarissime irregulariter remoteque subsinuato-dentata, marginibus apicibusque saepe ± undulata v. plicata, in marginibus, in petiolis et in nervo dorsali mediocriter v. dense pilosa ceterum sparsius pilifera aut fere glabra (pili rigidiusculi v. subsetacei), interdum in nervo dorsali (rarissime in tota parte aversa) subfloccosa, in margine nervoque dorsali praecipue basin versus fere semper glandulis minutissimis solitariis praedita, glauca v. viridi-glauescentia. Folia caulina 1—5 saepissime subsensim decrescentia, inferius petiolatum, reliqua v. omnia sessilia basi cuneata ± lanceolata v. lineari-lanceolata subintegerrima v. ± dentata cuspidata, plerumque in bracteas decrescentia, superiora subtus saepe densius floccosa. Inflorescentia laxa paniculata simplex vel composita saepe sat contracta, acodium 3—20 mm longum (raro longius), rami primarii (0—) 1—5 arrecti v. magis patentes suprafastigiati, ± floccosi simpliciter v. repetito-ramosi, capitula pauca v. subnumerosa. Involucrium 9—10,5 mm longum ovatum denique magis crassum, defloratum constrictum conicum, squamae angustae v. sublatiusculae e basi sat lata plerumque sat longe attenuatae pleraeque acutae intimae subulatae, sat obscurae v. dilutae margine virides, glandulis minutis sparsis v. mediocriter numerosis, pilis brevibus sparsis apice dilutis et floccis raris v. subdensis (in margine saepe densioribus) obtectae. Pedunculi saepissime canotomentosi sparsim v. subdensius pilosi saepissime sparsim glandulosi. Bracteae 1—4 minutae. Flores (saepe saturate) lutei saepissime subconspicui, ligulae fere semper breviter v. brevissime subciliatae, marginales saepe radiantes, stylus luteus interdum denique subfuscescens, achaenia subatra v. atrobrunnea.

Hab. in rupibus et locis petrosis siliceis Scandinaviae, Silesiae, Bohemiae, Prussiae rhenanae, Palatinatus, Valesiae, Galliae orientalis et austro-occidentalis et Scotiae. — Flor. Jun.—Aug.

Inter *H. vulgatum* et *H. Schmidtii* intermedium, sed *H. vulgato* magis affine.

Subspecies **rupigenum** Čelak., Durchforsch.-Ber. böhm. Phanerogam. (1888) p. 474; nec A.-T., Hier. alp. fr. (1888) p. 46; *H. rupicolum* v. *sudeticum* Uechtr., secundum G. Schneider, in „Das Riesengebirge in Wort und Bild“ fasc. 49 et 50 (1893) p. 20; *H. rupicolum* Fiek, Fl. v. Schlesien (1881) p. 272; nec Fries, nec Jordan; *H. saxifragum* ssp. *rupigenum* Zahn, in Koch Syn. (1901) p. 1823. Caulis (15—) 20—30 (—45) cm altus tenuis v. gracilis, interdum crassiusculus, striatus basin versus haud raro rubrobrunneus et pilis dispersis c. 2 mm longis dilutis adpersus, superne saepissime glaber, apicem versus saepe subfloccosus.

Folia rosularia 4—6 (—8) oblongo-lanceolata) vulgo longe) peiolatta remote repando-denticulata v. dentata, interdum basin versus rarius usque ad medium \pm sinuato-dentata, dentibus glanduloso-mucronatis, in petiolum alatum basi subvaginatem et subrubro-coloratum attenuata, omnia rigidiuscula, supra dilute viridia subglauca glabra, subtus albedo-viridia glaucescentia, in margine et in nervo dorsali modice disperseve pilosa, pilis 0,5—1 mm longis rigidiusculis v. subsetaceis, petioli mediocriter v. sat dense pilosi (2 mm). Folia caulina 0—2 (—3), inferius interdum radicalibus simile, saepissime angustius elongato-lanceolatum acutum, remote repando-denticulatum rarius profundius dentatum, superius (in caule bifoliato) fere semper anguste lineare basin versus attenuatum subpetiolatum, saepissime integerrimum rarius subdenticulatum. Inflorescentia laxissime paniculata (1—) 3—5 (—10) cephalae saepe indeterminata (interdum 1—2 caules laterales evoluti) suprafastigiata, rami primarii (0—) 1—3, ordines axium 2—3, accladium 15—35 (—50) mm longum. Involucrum 10—11 mm longum oblongo-ovatum denique subglobosum, squamae subangustae longe acuminatae, capitula iuniora longe superantes, obscurae v. subnigrae, pilis subdilutis 1,5—2 mm longis basi atris mediocriter numerosis, glandulis mediocriter v. satis numerosis obsitae, saepissime sparsim floccosae v. in margine densius stellatae, interiores nigrovirides. Pedunculi saepe subsquarrosi, superne disperse mediocriterve glandulosi (glandulis tenellis) et sat dense floccosi v. fere canotomentosi, pilis solitariis brevibus subsetaceis atris et aliis canis basi atris 1,5—2 mm longis mollibus obsiti. Bractee paucae minutae. Flores dilute aureolutes, ligulae apice sparsim breviterque ciliatae, stylus luteus denique fuscescens, achaenia subatra.

Hab. in montibus Riesengebirge 1150—1350 m: Kiesberg non infrequens (Uechtritz), Melzergrube, Kesselkoppe, Ziegenrücken, Aupagrund (Fiek), Plattenhöhe (Domin). — Flor. Julio, Aug.

Nulla modo varietas *H. rupicoli* Fries. — *H. rupicolum* v. *franconicum* [Griseb., Comm. p. 56; Reichb., Comp. tab. 187, fig. II], a G. Schneider loc. cit. sine iudicio cum *H. rupigeno* junctum et pro flora silesiaca indicatum, est propria et distinctissima species inter *H. bupleuroides* et *H. silvaticum* intermedia et usque adhuc paucis locis Germaniae australis tantum inventa.

Tab. 79, Fig. A. 1—3. *H. saxifragum* Fries ssp. *rupigenum* Čelak. (e fauce Melzergrube, leg. W. Conrad). 1. Squama exterior. 2. Squama interior. 3. Pedunculus sub involucri.

48. Hieracium onosmoides Fr., Symb. (1848) p. 102 (incl. *H. oreades* Fr., Symb. p. 100) = **vulgatum-Schmidtii** Zahn, in Koch Syn. (1901) p. 1822 et in Schinz et Kell., Fl. d. Schweiz (1905) II p. 304.

Characteres ut in *H. saxifrago*, at fere tota planta albopilosa v. setis longis strictis hispida. — Flor. Jun.-Aug.

Dispositio gregum:

- a. *Oreades* Zahn. Intense glaucum. Caulis albopilosus, folia margine subtusque piloso-crinita.
- b. *Onosmoides* Zahn. Glauco-pallens. Caulis basi setoso-comosus, folia setis longis strictis hispida.
- a. *Oreades* Zahn.

Subspecies **oreades** Fries, Symb. p. 100; Epicr. (1862) p. 88; Reichb., Comp. tab. 192, fig. 1 (forma macilentia); Zahn, l. c. p. 1823; nec Heuffel, in Flora (1853), nec N. P. I p. 282; *H. brumale* A. Schultz exsicc., non A.-T. — Caulis 30—60 cm altus rigidus foliosus albopilosus, vulgo ex omni ala, etiam foliorum radicalium ramosus, ramis foliosis.

Folia membranacea, subintegerrima v. medio denticulata rarius dentata, dense ciliata, 1—3 mm, eximie glauca; rosularia utrinque pilosa, exteriora subrotundata, reliqua oblonga obtusiuscula, in petiolum dense albocrinatum \pm longum v. sat brevem sensim attenuata, in margine densius ciliata et hinc inde una alterave glandula minuta obsita; caulina 2—4 rarius complura sessilia subsensim in bracteas decrescentia et angustiora basi angustata. Inflorescentia saepe indeterminata, in speciminibus minoribus simplex, in elatioribus ramosissima, acladium 10—25 mm longum, rami primarii (0—) 3—5 v. complures, ordines axium 3—4, capitula (1—) 5—15 (—25). Involucrum 10—12 mm longum ovatum denique tumidum, defloratum utrinque truncatum nec constrictum, squamae lineari-attenuatae, exteriores et mediae adpressae, \pm obtusae, interiores acuminatae nec cuspidatae obscurae margine virides, sparsim medio-criterve (basin versus) floccosae eglandulosae v. rarius glandulis minutis solitariis obsitae sed pilis 1—2,5 mm longis albis nigrobulbosis subcrinitae v. disperse pilosae. Pedunculi leviter canotomentosi et sparsim minuteque glandulosi v. fere eglandulosi, sed pariter ac tota inflorescentia sat dense albopilosi, 1,5—3 mm. Bracteae 1—3 minutae. Flores lutei, ligulae apice ciliatae, stylus luteus, achaenia 4—4,5 mm longa fusca.

Hab. ad lacus maiores Sueciae (Fries); Germaniae: in rupibus porphyraceis pr. Trotha Saxoniae (A. Schultz!).

Exsiccata: Fries, Herb. norm. XII no. 16.

Tab. 79, Fig. B. 4, 5. *H. onosmoides* Fries ssp. *oreades* Fries (pr. Trotha, leg. A. Schultz). 4. Squama. 5. Pedunculus sub involucrio.

b. *Onosmoides* Zahn.

Subspecies **porphyritae** F. Schultz, Oesterr. bot. Zeitschr. (1872) p. 210 (nec porphyriticum A. Kerner, Oesterr. bot. Zeitschr. 1863 p. 247). Caulis 30—40 cm altus gracilis v. crassiusculus rigidiuscule pilosus basin versus dense et longe setosus et haud raro purpureo-violaceus, apice subfloccosus. Folia rosularia subnumerosa prasino-glauca v. glaucopallida rigidiuscula, breviter petiolata, oblongo-lanceolata v. lanceolata acutiuscula v. breviter acuta, saepe subundulata et subplicata, basin versus in petiolum subalatum sensim angustata, \pm (interdum grosse) dentata, utrinque setoso-pilosa, in margine densius longiusque setosa, in nervo dorsali et praecipue basin versus setis ad 5 mm longis crinita, praeterea in margine nervoque dorsali glandulis solitariis minutis praedita; caulina 3—5 subsensim v. cito in bracteas decrescentia sessilia lanceolata v. angustiora, summa saepissime bracteiformia et in nervo dorsali saepe subfloccosa. Inflorescentia valde indeterminata, caulis haud raro ex omni ala ramosa, ramis elongatis foliaceis, acladium 20—50 mm longum, rami primarii (3—) 6—10 oblique erecti rigidiuscule pilosi, 2—3 (—4) mm, ordines axium 3—4, capitula (3—) 5—25 v. complura. Involucrum 11—13 mm longum ovatum denique crassius, squamae subangustae acuminatae \pm acutae, praesertim basin versus subfloccosae v. parciflocae, subpilosae (1,5—2 mm), exteriores glandulis solitariis praeditae, interiores vulgo glandulosae nigrovirides viridi-marginatae. Pedunculi canotomentosi subpilosi disperse sparsimve glandulosi, graciles. Bracteae saepissime numerosae interdum sub involucrio confertae, squamiformes. Flores lutei, ligulae apice subciliatae, stylus luteus, achaenia fusca.

Hab. ad limites Palatinatus rhenani et Prussiae rhenanae in rupibus porphyraceis pr. Muenster a. Stein et Kreuznach: Rotenfels (F. Schultz).

Subspeciei *onosmoides* Fr. valde affine, at differt involucriis haud cano-floccosis etc. Typica subsp. *onosmoides* a me in rupibus porphyraceis m. Donnersberg Palatinatus inventa est.

Exsicc.: F. Schultz, Herb. norm. nov. ser. cent. I no. 96.

Variat: $\alpha*genuinum* Zahn; *H. Brandisii* Freyn, Bull. herb. Boiss. (1895) no. 10; *H. Schlosseri* Freyn olim in sched. Caulis supra medium omnino epilosus et saepissime scapiformis (folia abrupte decrescentia).$

1. *normale* Zahn. Involucra et pedunculi pilosa canofloccosa glandulosa

- v. pedunculi tantum subfloccosi (tum caulomata effloccosa). — Bosnia: In m. Vlašić pr. Kajabaša (Brandis); Hercegovina: Glogovo planina pr. Jablanica (Fiala!).
2. subpilosum Zahn. Involucra (et interdum etiam pedunculi pilis) solitariis praedita. — Bosnia: In m. Vlašić pr. Kajabaša (Brandis), Trebević pr. Sarajevo 1400 m (Fiala).
- β) **plumulosum** A. Kerner l. c. Caulis omnino pilis brevibus plumosis sursum saepe minus numerosis obsitus, pedunculi et involucra breviter mediocriterque plumoso-pilosa.
1. normale Zahn (*H. plumulosum* verum A. Kerner; *H. plumulosum* Freyn l. c. p. p.). Caulis (20—) 30—50 cm altus, basi tantum dense foliosus pseudophyllopodus, saepe summae tres partes scapiformes v. foliis paucis remotis parvis obsitae. — In m. Lovcen et Orjen 1250—1650 m pr. Cattaro Dalmatiae (Pichler). Bosnia: In m. Vlašić pr. Kajabaša (Brandis), in m. Romanja planina: Crvena stjena (G. Beck). In v. Narentatal (R. Keller). Montenegro: in rup. calc. inter Njegus et Cetinje (Sagorski).
2. vlasitschense Freyn l. c.; *H. tridentatum* < *Waldsteinii* Freyn l. c.; *H. Schlosseri* Freyn olim in sched. p. p. Caulis 40—60 cm altus, foliis numerosis subremotis sensim decrescentibus saepe minute denticulatis acutiusculis mucronatis magis elongatis late lanceolatis v. oblongis obsitus, involucrum paulo maius. — In m. Vlašić pr. Kajabaša 14—1600 m (Brandis).

Nullo modo propria species! Involucrum ad summum 13 mm longum nunquam 15 mm ut Freyn l. c. docet). Ab *H. plumuloso* typico tantum foliis usque ad apicem caulis sensim decrescentibus differt. Formulae *tridentatum* < *Waldsteinii* nullo modo respondet. Ut in *H. racemoso* formas pseudophyllopodas in formas regulariter foliosas transeuntes videas.

Exsiccata: F. Schultz, Herb. norm. cent. XXVI no. 2560 et Baenitz, Herb. europ. (1897); Fl. austro-hung. 3334 p. p.; Zahn, Hieraciotheca Europ. no. 60.

Tab. 87. *H. Waldsteinii* Tausch ssp. *plumulosum* A. Kern. (α 2) (e m. Vlašić, leg. Brandis). 1. Squama. 2. Pedunculus sub involucro. 3. Pilus caulis (c. 20:1). 4. Pilus marginis foliorum (c. 100:1).

1* Caulis subfloccosus, caulomata canotomentosa.

Subspecies **nipholeucum** Zahn; *H. Baldaccii* Halacsy, Oesterr. bot. Zeitschr. (1891) p. 223, nomen solum; nec. *H. Baldaccianum* Freyn, Bull. herb. Boiss. (1895) no. 10; *H. Delpinoi* Freyn l. c. p. 660; nec. Baldacci in sched.! et Malpighia VI (1892), Sep. p. 113. Caulis 20—45 cm altus basi v. in inferiore parte tertia densissime tomentosus et dense foliatus, pseudophyllopodus v. hypophyllopodus. Folia magna late elliptica v. ovato-rhomboidea (16:5 ad 18:6 cm) saepissime in petiolum distinctum brevem haud crassum breviter angustata obtusa mucronata v. acutiuscula integerrima v. saepe levissime remoteque sinuato-denticulata, dentibus minutis obtusiusculis, interdum margine subundulata, abrupte decrescentia, super folia conferta 4—7 multo minora ovata sessilia evoluta, omnia crassiuscula pilis brevissimis

plumosis valde crispis densissime et crassiuscule tomentosa nipholeuca, (etiam petioli) tomento adpresso, itaque in parte aversa nervis prominentibus. Inflorescentia racemosa v. laxe paniculata, acladium 5—15 (in formis putatis ad 50) mm longum, rami primarii 2—7 tenues obliqui, superiores subconferti infimi remoti, ordines axium 3 (—4), capitula 5—15 (—25), involucrium 7—10 (—11) mm longum, squamae imbricatae lanceolatae acutae canovirides v. incanae dilutius marginatae, densissime canofloccosae v. albae dense minutissimeque luteo-glandulosae epilosae; pedunculi ad 6 bracteati tenues canofloccosi minutissime glandulosi epilosi. Caulis ubique floccosus v. partim effloccosus, interdum in parte inferiore usque ad medium plumoso-subpilosum. Achaenia 2,5—3,5 mm longa, denique dilute luteo-brunnea.

Hab. in Albania: in rupestribus supra Selce, distr. Klementi (A. Baldacci, Iter Alban. VII no. 281!), in rupestr. fl. Brskut, distr. Kuči (A. Bald., It. Alban. VIII no. 257!), ad fl. Cem pr. Selce (A. Bald., It. Alban. VIII no. 155!), in rup. ad Strapče [Mala Rijeka] (A. Bald., It. Alb. VIII no. 189!), in rup. m. Joko (v. Soko?), distr. Trijepši (A. Bald., It. Alb. VIII no. 96!) Montenegro: in rup. travertineis ad cataractam rivuli sub coenobio St. Stephani Morače. (Baldacci sub nomine *H. Baldaccii* Halacsy!) et in conglomeratis ad Kolaschin (Bald.).

Capitula et caulomata plantae iunioris sunt valde lacteo-tomentosa et specie quasi eglandulosa glandulis valde brevibus in tomento occultis. Itaque cl. Freyn describit plantam omnino „eglandulosam.“ *H. Delipinoi* Baldacci!, in sched. auctoris ipsius, ab nostra subspecie omnino diversum est et cum descriptione cl. Freynii, in Bull. herb. Boiss. l. c. nullo modo convenit, quia Freyn nostram subspeciem hoc loco describit.

Subspecies **thapsiforme** Uechtr., in litt. ad Pančić, et apud N. P. II p. 291; nec Vis., Fl. dalm. suppl. alt. p. 64, tab. VI; nec Freyn, in Bull. herb. Boiss. (1895) no. 10; *H. thapsoides* Pančić, Elench. Crna gora (1875); nec Arv.-Touv. — *H. nipholeuco* valde affine, sed differt acladio 4—8 cm longo, involucriis pilis plumosis mollibus 0,5—1 mm longis obtectis pariter ac pedunculis omnino eglandulosis, etc.

Hab. in Serbia: in montibus Mokragora (Pančić). In Montenegro verosimiliter deest.

Planta Visianii et Freynii cum descriptione auctorum N. P. l. c. nullo modo congruit, qui plantam Pančićianam a cl. Uechtritz denominatam describunt.

b. Suborieni Zahn.

Subspecies **suborieni** Zahn = *plumulosum* > *gymnocephalum* Zahn; *H. gymnocephalum* β) *plumulosum* 2) *nudicaule* N. P. II p. 293 p. p.; nec Griseb. Folia magna ter longiora quam lata, 10—20 cm longa, late elliptica obtusa v. saepissime acutiuscula mucronata basi sensim in modum petioli angustata, leviter remoteque sinuato-denticulata, pilis plumosis brevissimis valde crispis densissime adpresso-tomentosa crassiuscula, tomento sericeo laxiore quam in grege Plumuloso, in inferiore caulis parte ± dense conferta, abrupte decrescentia. Caulis ad 60 cm altus, inter folia magna densissime tomentosus, supra folia magna scapiformis omnino glaber obscure viridis, caulomata etiam obscuriora. Inflorescentia paniculata v. altefurcata, acladium 1—5 cm longum, rami primarii ad 8, inferiores remoti oblique patentes siccitate obscuri, ordines axium 3, capitula 3—8 (—20), ramalia inferiora saepe haud evoluta. Involucrium sat magnum late ventricosum-globosum depressum 11—14 mm longum obscure olivaceum more *H. gymnocephali*, squamae latae lanceolatae acuminatae acutae imbricatae obscure v. interiores praecipue in margine dilutius olivaceo-virides, dense minuteque luteo-glandulosae, epilosae, secundum nervum dorsalem parcefloccosae, exteriores basin versus subfloccosae. Pedunculi obscure virides subsulcato-striati (ut etiam caulis), apice

leviter incrassati et subfloccosi minuteque subglandulosi, basin versus cito glabri. Bractee 3—6 squamiformes. Ligulae sat conspicuae, achenia dilute luteo-brunnea.

Hab. in Bosnia australi: In valle Miljačkatal prope Sarajevo: iuxta pagum Da Riva 560 m (K. Maly), Plaša planina (G. Beck); Hercegovina: In montibus Glogovo planina pr. fontem Alina voda (K. Maly), in Grabovica pr. Jablanica (G. Beck), in rupestribus m. Visočica planina pr. Umoljani, distr. Konjica (Fiala); Montenegro: in montibus Lovcen!, Stürovník! et Sella! pr. Cattaro (Pichler, in Fl. austro-hung. exs. no. 3334 p. max. p.); Dalmatia: in m. Orjen 1600 m (Vandas!); Serbia occidentali: in m. Kowlje et Mokragora (Panč. apud N. P. II p. 293).

c. Lanifolium Zahn.

Subspecies **sublanifolium** Zahn; *H. gymnocephalum* N. P. II p. 292 p. p.; Sagorski exsicc.; *H. lanatum* var. *canostellatum* Huter exsicc.; *H. thapsiforme* Freyn, in Bull. herb. Boiss. (1895) no. 10; Vis., Fl. dalm. suppl. alt. p. 64, tab. VI; nec Uechtr. Inter *H. plumulosum* et *H. Schlosseri* Rehb. fil. quasi intermedium. Caulis 30—40 cm altus subsulcato-striatus epilosus v. disperse pilosus eglandulosus apice floccosus saepissime usque ad inferiorem partem lanatam subfloccosus, basi v. paulo altius dense foliatus, saepissime pseudophyllopodus v. interdum hypophyllopodus, summae duae partes scapiformes virides. Folia magna ovata v. oblongo-ovata v. elliptica acutiuscula v. breviter acuta mucronata basin versus attenuata interdum late alato-subpetiolata, rarissime remote denticulata, fere semper integerrima, utrimque pilis sericeis albis crispis basi plumosis apice flagellatis ad 3 mm longis dense tomentoso-lanata, sed color dilute viridis distincte translucens, in nervo dorsali praecipue basin versus pariter ac in caulis basi pilis longioribus densissime villosopellita, supra folia magna 1—2 multo minora v. tantum bracteiformia inserta, haec supra saepissime (epilosa lineari-lanceolata. Inflorescentia laxa paniculata indeterminata, acladium 1—5 cm in plantis putatis ab animalibus depastis saepe ad 8 cm) longum, rami primarii 2—5, inferiores valde remoti arcuato-patentes, ordines axium 3, capitula 3—10, ramalia inferiora saepe haud evoluta. Involucrum 11—12 (—13) mm longum late globosum denique ventricosum depressum, squamae valde imbricatae lanceolatae acutae obscurae dilutius submarginatae, dense floccosae v. canae, pilosae v. disperse pilosae, fere eglandulosae v. saepius sat dense glandulosae. Pedunculi crassiusculi rigidi dense floccosi v. canotomentosi, fere eglandulosi v. subglandulosi saepissime epilosii. Achaenia 4—4,5 mm longa, matura dilute luteo-brunnea.

Hab. Hercegovina: In declivitatibus montosis m. Porim pr. castellum Ruište pr. Mostar 1400 m (Vandas!), in m. Glogovo planina pr. Jablonica (Vandas), inter Artovac et Bilek pr. Trebinje (Brandis), ad limites Hercegovinae-Bosniae ad Krstac (id.); Bosnia: in m. Ilica 1550—1650 m (Handel-Mazzetti et Janchen), in m. Vlašić pr. Kajabasa (Brandis), Han Stepen ad limites Cernagorae 920 m (id.); Montenegro: Lovcen (Gelmi), Krstac pr. Cattaro (G. Beck), Njegos 1000 m (Sagorski); Dalmatia: In m. Stuerovník (Pichler), Matteo in Dobrota (Studniczka), Velebit (leg.?), Mte Vipera (G. Beck), in m. Mossor pr. Spalato (de Degen); Croatia: in m. Sveto Brdo ad pagum St. Rochus in limite dalmatico 1850 m (Borbás).

Variat: 1) normale Zahn; *H. thapsiforme* Freyn l. c., nec N. P. Caulomata et involucria epilosa v. interdum pilis valde solitariis obsita.

a) *subeglandulosum* Zahn. Involucrum et pedunculi dense floccosa fere eglandulosa. — Bosnia: Han Stepen.

b) *glandulosum* Zahn. Involucrum mediocriter v. sat dense glandulosum. — Njegus, in m. Vlašić, etc.

2) *subpilosum* Zahn. Caulomata sparsim v. sat disperse pilosa, involucrum sat dense floccosum et glandulosum, pilis solitariis v. mediocriter numerosis longe flagellatis ad 2,5 mm longis obsitum. — Njegus, Vlašić, Krstac, etc.

Subspecies **Delpinoi** Bald.! in sched. et in Altre notizie intorno alla flora del Montenegro, in Malpighia VI (1892), Sep. p. 113; nec Freyn, in Bull. herb. Boiss. (1895) no. 10. — *H. nipholeuco* (= *H. Baldaccii* Halacsy) valde similis, at praecipue differt foliis laxius tomentoso-et sericeo-lanatis nec brevissime adpresso-tomentosis. Caulis crassiusculus 25—50 cm altus superne scapiformis ± floccosus epilosus. Folia in caulis basi v. paulo altius conferta magna oblongo-ovata v. elliptica obtusa v. acutiuscula mucronata, inferiora breviter petiolata, omnia basin versus angustata, in margine irregulariter leviterque subundulato-sinuata, crassiuscula, pilis 2—3 mm longis sericeis plumosis apice flagellatis densissime crispo-sublanata subtomentosa, in nervo dorsali petioloque pilis ad 5 mm longis albo-sericeis densissime villosopellita, color lutescenti-viridis per indumentum translucens. Acladium (10—) 30—45 (—65) mm longum, rami primarii ad 6 remoti oblique erecti, ordines axium 3, capitula pauca v. ad 16. Involucrum 9—12 mm longum, squamae latiusculae lanceolatae acutae obscurae sed floccis albido-canace, epilosae minutissime subglandulosae (glandulae in planta nondum florente inter tomentum occultae). Pedunculi dense floccosi fere eglandulosi. Bracteae c. 4 squamiformes. Achaenia dilute luteo-brunnea.

Variat: α) **genuinum** Zahn. Involucrum dense floccosum microglandulosum. — Albania: in saxosis m. Vels, distr. Zarima (A. Baldacci, Iter Alb. V no. 129!), in glareosis ad Gjuraj infra Gioani et Planti, distr. Skutari (A. Bald. l. c. no. 186!).

β) **glandulosum** Zahn. Involucrum et pedunculi minus dense floccosi sat dense glandulosi, glandulis longioribus etiam in apicem caulis descendentibus. — Greća (Trijepsi), distr. Klementi Albaniae (A. Bald., It. Alb. VIII no. 265).

Subspecies **lanifolium** N. P. II p. 293; verosimiliter = *H. lanatum* W. Kit. l. c. = *H. Waldsteinii* Tausch, in Flora (1827), Erg.-Bl. p. 65; nec N. P.; *H. eriophyllum* Vukot. in sched. et in Rad. jugosl. Akad. VII p. 77 (1869); nec alior. Transitus *plumulosum* > *Italica*. Caulis 30—45 cm altus gracilis striatus hypophyllopodus. Folia subnumerosa caulis basin versus ± dense conferta (caulis pseudophyllopodus) sat magna elliptica v. lanceolata basin versus angustata, acuta, argute v. subsinuato- et serrato-dentata dilute viridia subcrassiuscula, abrupte decrescentia, caulis duae partes superiores scapiformes, 3—5 foliis parvis lanceolatis v. linearibus remotis ± bracteiformibus obsitae. Inflorescentia saepissime altifurcata, acladium 3—6 (—11) cm longum, rami primarii 1—3 (—5) remoti graciles subarcuato-ascendentes, ordines axium 2—3 (—4), capitula 2—5 (—16). Bracteae 3—4 minutae. Involucrum 12—13 mm longum subventricosum, squamae latae lanceolatae acutae obscurae dilutius marginatae. Pili in involucro nulli v. dispersi diluti 2—3 mm longi, caulomata saepissime epilosa, caulis inter folia magna densissime pilosus, folia utrimque pilis albis sericeis basi subplumosis apice longe flagellatis 4—6 mm longis densissime villososublanata, color viridis eximie translucens. Glandulae involucri densae, breves longioribus immixtae, in pedunculis superne tantum dispersae. Flocci involucri densi, pedunculi superne dense

floccosi, inferne minus floccosi, caulis usque ad partem lanatam subfloccosus. *Achaenia* dilute luteo-brunnea, 3,5 mm longa.

Hab. Croatia: Velebit (Vukot.), Lubiko Brdo (Pichler), inter Brusano et Ostaria (de Degen!); in m. Crnopač supra Gračač 1300 m (de Degen!), in montibus Laginac et Badani pr. Ostaria (Pichler, Fl. austro-hung. 3335!); Bosnia: Osjeđenica planina pr. Petrovac (Fiala), in rupestribus ad Barica haud procul a Mrković pr. Sarajevo (K. Maly), ad saxa calc. pr. Sarajevo (G. Beck), Ravni potok pr. Drvar 680 - 750 m (Janchen).

Tab. 88. *H. Waldsteinii* ssp. *lanifolium* N. P. (inter Brusano et Ostaria, leg. A. de Degen). 1. Margo ligularum. 2. Squama. 3. Pedunculus sub involucrio. 4. Pilus marginis foliorum (20:1).

56. Hieracium gymnocephalum Griseb., apud Pantocsek, Oesterr. bot. Zeitschr. (1873) p. 266; nec N. P. II p. 292.

Caulis gracilis v. crassiusculus 15—65 cm altus subsulcato-striatus (pseudophyllopodus v.) hypophyllopodus, inferne inter folia magna dense lanato-tomentosus, superne omnino glaber obscurus v. pilis solitariis praeditus, semper effloccosus, apicem versus interdum sparsissime glandulosus. Folia ad 15 in caulis basi dense conferta v. parum remota et in inferiore tertia v. dimidia parte caulis inserta magna lanceolato-oblonga v. lingulata interdum elongato-lanceolata obtusa mucronata v. breviter acuta basin versus \pm longe sensimque attenuata haud petiolata (superiora brevius attenuata sessilia), integerrima v. inconspicue subdenticulata, viridia, utrimque pilis sericeis crispis albis basi plumosis apice flagellatis 2—3 mm longis dense intertexto- et villosolana, in nervo dorsali praecipue basin versus (ut etiam caulis inter folia) densissime villosolana-pellita (pilis ad 6 mm longis), sursum abrupte decrescentia remota multo minora supra glabriora v. glabra et in bracteis ciliatas v. omnino glabras trans-euntia. Inflorescentia laxa paniculata v. altefurcata, acacladium 2—15 cm longum, rami primarii 1—7 remoti arcuato-erecti crassiusculi v. graciles obscuri vulgo omnino glabri, interdum pilis basi crassiusculis obscurisque v. glandulis dispersis obsiti, semper effloccosi, ordines axium 2—3 (—4), capitula (1—) 2—8 (—16). Involucrum 12—15 mm longum ventricosum obscure olivaceo-viride, squamae valde imbricatae latae lanceolatae acutae v. exteriores acutiusculae denique \pm laxae, omnino glabrae aut glandulis solitariis v. sat densis v. etiam pilis 2—3 mm longis basi crassiusculis solitariis dispersisve obtectae saepissime omnino effloccosae, siccitate subnigrae. Pedunculi \pm crassiusculi apice leviter incrassati fere semper glabri, interdum pilis parum numerosis glandulisque solitariis v. subnumerosis muniti, sed fere semper omnino effloccosi. Bractee 4—8 squamiformes. Flores lutei, ligulae apice glabrae, stylus luteus; achaenia dilute luteo-brunnea v. dilute brunnea, 4—5 mm longa.

Hab. in Albania, Montenegro, Bosnia, Hercegovina, Dalmatia, Croatia. — Flor. Iul., Aug.

Subspecies ***gymnocephalum*** Griseb. l. c. et Wettstein, Beitr. Fl. Albaniens (1892) p. 73; *H. boreale* < *orien*i Freyn, in Bull. herb. Boiss. (1895) no. 10. Caulis ad 65 cm altus strictus rigidus inferne dense foliosus et inter folia dense villosolana superne omnino glaber obscure-viridis. Folia c. 15 magna viridia late elliptica v. oblonga acuta, inferiora petioliformia attenuata, superiora breviter angustata sessilia, primo sensim decrescentia, iam infra caulem medium abrupte in folia parva et cito in bracteis ciliatas v. nudas decrescentia. Inflorescentia altefurcata, rami primarii ad 7 remoti oblique erecti stricti crassiusculi nigro-

virides, ordines axium 3 (—4), capitula 3—8 (—16), ramalia inferiora saepe haud evoluta. Involucrum valde imbricatum nigro-viride glabrum, squamae late triangulariter-lanceolatae acutiusculae v. acutae.

Montenegro: in valle Perućicadol infra m. Kom (J. Pantocsek); Albania: ad saxa m. Ljubitrn 2000 m (Doerfler), supra Selce, distr. Klementi (A. Baldacci, It. Alb. Peninsula Balcanica; Asia Minor.

Dispositio gregum:

- a. *Pannosum* Zahn. Caulis humilis haud plus 40 cm altus, inferne foliis magnis dense foliatus, saepissime supra folia magna fere sine transitu bracteis nonnullis paucis obsitus et (saepe iam a basi) in ramos elongatos dissolutus. — Sp. *pannosum* Boiss., *Friwaldii* Rehb. f., *mokragorae* N. P., *parnassi* Fr.
- b. *Bornmuelleri* Zahn. Caulis elatus (15—) 40—60 cm altus, foliis sat magnis subremotis sensim decrescentibus praeditus, apice longe ramosus. — Ssp. *Bornmuelleri* Freyn.

Subspecies **Bornmuelleri** Freyn, Oesterr. bot. Zeitschr. (1891) p. 54; Bull. herb. Boiss. (1895) no. 10. Caulis (15—) 40—60 cm altus crassiusculus subflexuosus subanguloso-striatus, apicem versus floccosus, eglandulosus, ubique et praecipue in parte foliata pilis 5—7 mm longis breviter ramosis usque ad apicem denticulatis albis basi rigidiusculis apice crispulis densissime villosus, aphyllopodus. Folia caulina 10—25 subremota v. in exemplaribus humilioribus sat dense conferta, infima florendi tempore emarcida, reliqua sessilia sensim decrescentia, inferiora oblongo- v. elliptico-lanceolata supra medium latissima acutiuscula v. acuta mucronata rarius subobtusata, basin versus longius attenuata, 35 mm lata quater longiora, remote leviterque sinuato-denticulata, dentibus glanduliformibus, media oblonga basin versus brevius subattenuata, superiora ± elliptica breviter acuta basi ± rotundata interdum subdentata, in bracteas foliaceas decrescentia, omnia ± papyracea viridia utrimque et praecipue subtus dense pilosa, in nervo dorsali margineque dense villosa, pilis subrigidiusculis subcrispis basi breviter dentatis usque ad apicem denticulatis. Inflorescentia furcata saepe ± indeterminata, acladium ad 15 cm longum, rami primarii 1—5 (v. complures, sed haud evoluti) crassiusculi erecti subflexuosi elongati, inferne subfoliosi apice bracteati, inferiores arcuato-erecti foliosi 1—3 cephalii, superiores monocephali, capitula (1—) 2—5 (—10). Involucrum ad 15 (—18) mm longum crasse ovatum denique late ventricosum, squamae sublatiusculae acuminatae acutiusculae, dorso obscure in margine pallide virides, apice saepissime obscurae, omnes pilis denticulatis dilutis basi rigidiusculis 2—3 mm longis dense crispo-villosae effloccosae, sed glandulis minutis luteolis mediocriter numerosis obsitae, exteriores angustiores. Pedunculi apice incrassati et glandulis dispersis obsiti, ubique subcanotomentosi et pilis ad 7 mm longis superne mediocriter numerosis inferne sat densis patentibus praediti. Bracteae 3—4 subremotae lineares sat dense pilosae. Flores intense flavi, ligulae apice glabrae, stylus initio concolor denique fuscescens, achaenia 4,25 mm longa denique dilute brunnea.

Habitat in *Asia Minore* p. e. in Paphlagonia, Tossia: in pinetis inter Schakirla et Jokariki-Dikmen (Sintenis, exs. 4667 anno 1892); Galatia: Amasia (Bornmueller, exs. 1446 anno 1889); Cappadocia: Ak-Dagh 19—2100 m (Bornmueller anno 1889); Armenia Turcica: Baschtasch ad Euphratem 1650 m (Sintenis, exs. 2919^b anno 1890). — Flor. Iul., Aug.

Nullo modo propria species, ut cl. Freyn l. c. docet, sed sine dubio subspeciebus *H. pannosi* adscribenda. Comparationis causa plantam Freynianam hoc loco depingimus.

Tab. 90. *Hieracium pannosum* Boiss. ssp. *Bornmuelleri* Freyn (planta in horto Oenipontano e seminibus cl. Bornmuelleri educata; leg. J. Murr aestate 1906). 1. Dentes ligularum. 2. Squama. 3. Pilus squamarum. 4. Pedunculus sub involucri. 5. Pilus caulis.

Species intermediae.

58. Hieracium Guentheri Beckii Zahn = **gymnocephalum—villosum** Zahn.

Phyllopodum v. hypophyllopodum. Caulis 15—30 cm altus flexuosus gracilis, inferne viridis v. saepe violaceus, supra medium nigro-viridis (more *H. gymnocephali*), foliis sensim decrescentibus v. in exemplaribus minoribus basin versus \pm approximatis superne abrupte decrescentibus obsitis, ubique sat dense v. basin versus dense pilosus. Folia radicalia florendi tempore 1—2 evoluta v. iam emarcida, inferius interdum subspathulatum calvenscens; caulina 4—10 sublutescenti-viridia glaucescentia sat magna remote leviterque subsinuato-denticulata subundulata late lanceolata v. lanceolata acutiuscula, inferiora basin versus sensim angustata ad 11:3 cm longa, media paulo angustata basi rotundata-subamplexicaulia, superiora oblongo-v. elliptico-lanceolata multo breviora basi paulo angustata \pm amplexicaulia, in bracteas lineari-lanceolatas decrescentia; omnia utrimque densissime pilosa, in nervo mediano subtus supraque subpellita, sed color foliorum bene translucens. Pili subsericei breviter dentati apice longe flagellati, 3—6 mm longi, apicem caulis versus rigidiores v. subsetacei basi crassati obscuri tantum denticulati. Inflorescentia monocephala v. \pm furcata, acladium 3—6 cm $-\frac{2}{3}$ totius caulis longum, rami primarii 1 (—2) monocephali, capitula, 1—2 (—3). Involucrum 12—14 mm longum crasse ventricosum-globosum, squamae latae lanceolatae acuminatae acutae (haud acutissimae) obscurae olivaceo-marginatae, pilis 3—4 mm longis rigidiusculis flexuosis tantum denticulatis et glandulis dispersis minutis obsitae, *effloccosae*. *Pedunculi glandulis dispersis minutis* et pilis subnumeris 3—5 mm longis obsiti *omnino effloccosi v. apice tantum* sparsissime floccosi. Flores lutei, ligulae apice glabrae, stylus luteus, achenia 4—4,5 mm longa brunnea.

Albania, Bosnia. — Flor. Iul., Aug.

Subspecies **eriodermum** Zahn, in sched. herb. mus. Sarajevensis (1903). Phyllopodum v. hypophyllopodum. Folia caulina c. 8—10 sursum saepe cito decrescentia. Acladium 3—6 cm longum, capitula 1—2 (—3).

In rupestribus alpinis supra Miočev-dô ad Rikavac, distr. Kuči Albaniae (A. Baldacc, It. Alb. VI 1898 no. 36).

Subspecies **Guentheri Beckii** Zahn. Hypophyllopodum. Folia caulina 4—6 sensim decrescentia. Acladium $\frac{1}{2}$ — $\frac{2}{3}$ totius caulis, capitula 1 (—2). Involucrum mediocriter tenuiterque glandulosum.

In m. Volujac planina Bosniae (G. Beck).

Tab. 91, Fig. A. 1—3. *H. Guentheri Beckii* ssp. *Guentheri Beckii* Zahn (planta Beckiana!). 1. Squama. 2. Pedunculus sub involucri. 3. Pilus foliorum.

59. Hieracium Scheppigianum Freyn, Bull. herb. Boiss. (1895) no. 10 = **gymnocephalum—scorzonerifolium** Zahn; *H. Orieni* < *scorzonerifolium* Freyn l. c.

Bosnia, Croatia, Hercegovina, Albania.

Subspecies **Scheppigianum** Freyn l. c. Habitus ut in *H. scorzonerifolio*. Caulis 20—40 cm altus gracilis v. crassiusculus subflexuosus substriatus erectus phyllopodus, superne pilosus effloccosus eglandulosus, inferne subpilosus violaceus. Folia haud numerosa glauca rigidiuscula, rosularia oblonga spathulata, caulina 2—4 sensim decrescentia, inferiora late lanceolata basin versus longe attenuata acuta, superiora lanceolata basin versus subattenuata v. basi rotundata sessilia, omnia integerrima v. remote denticulata, utrimque disperse pilosa, in margine et praecipue in nervo dorsali pilis numerosioribus obsita vix villosa, pili praecipue basin versus distincte subdentati, 3—5 mm longi. Inflorescentia profunde v. altefurcata 1—5 cephala; acladium $\frac{1}{6}$ — $\frac{1}{3}$ totius caulis. Involucrum c. 12 mm longum ventricosum ovatum; squamae latiusculae lanceolatae, exteriores obtusae obscurae v. subnigrae fere immarginatae, interiores dilutiores acutiusculae v. acutae \pm late diluteque marginatae, omnes eglandulosae fere pilosae v. pilis brevibus subrigidis solitariis munitae, effloccosae v. floccis sparsis adspersae. Pedunculi epilosus eglandulosus, apice tantum subfloccosi et leviter incrassati. Bractee 3—4 lineares, superiores squamiformes. Flores intense flavi, ligulae apice glabrae stylus luteus denique fuscescens; achaenia 3,5 mm longa dilute brunnea.

Hab. Hercegovina: In m. Vuči Zub (Vandas); in m. Prasa supra vallem Dobri Do 1400 m (id.).

Subspecies **plišivicae** Deg. et Zahn, apud Zahn, in Mag. bot. lap. (1906) p. 70; *H. flexuosum*—*orien*i Zahn l. c. Habitus ut in *H. subspecioso* ssp. *subspecioso* N. P. Caulis 15—25 cm altus gracilis, interdum crassiusculus, subflexuosus substriatus erectus, phyllopodus, subpilosus effloccosus eglandulosus, basin versus densius pilosus (pilis 3—5 mm l.) et saepe \pm violaceus. Folia glauca rigidiuscula, rosularia sat numerosa lanceolata acutiuscula v. acuta mucronata, basin versus longe attenuata, interdum fere subpetiolata, remote denticulata, utrimque pilis minute denticulatis subpilosa, in margine nervoque dorsali pilis rigidiusculis 3—5 mm longis numerosioribus obsita, in margine basin versus saepissime glandulis minutis solitariis praedita. Folia caulina 2—5 saepissime abrupte decrescentia lanceolata acuta radicalibus similia, summa linearia. Inflorescentia alte v. profunde furcata, fere semper (1—) 2 cephala; acladium $\frac{1}{5}$ — $\frac{3}{4}$ totius caulis. Involucrum 10—12,5 mm longum late ovatum denique depressum; squamae imbricatae basi latiores, lanceolatae, exteriores obtusiusculae dorso nigro-virides, interiores acutae margine dilute virides, omnes breviter obscureque subpilosae (1 mm) breviter subglandulosae et praecipue basin versus mediocriter floccosae. Pedunculi apice incrassati sub involucrio tantum dense floccosi v. leviter cani, inferne cito effloccosi, ubique disperse obscureque pilosi (1 mm) et glandulis minutis subsparsis obsiti. Bractee 3—4, inferiores lineares subfoliaceae, superiores sub involucrio confertae angustiores quam squamae. Flores saturate lutei, ligulae apice glabrae; stylus luteus leviter brunnescens; achaenia dilute brunnea.

Hab. in Croatia: in rupestribus calc. m. „Plišivica“ prope Korenicam 1600 m (A. de Degen, 12. 8. 1905) inter *H. scorzonerifolium* ssp. *flexuosum* W. Kit. et *H. gymnocephalum* Griseb. ssp. *orien*i A. Kerner.

Tab. 91, Fig. B. 4—5. *H. Scheppigianum* Freyn ssp. *plišivicae* Deg. et Zahn (planta Degeniana). 4. Squama. 5. Pedunculus sub involucrio.

60. Hieracium Burnati A.-T., in Burnat et Gremli, Catal. Hieracium Alpes maritimes (1883) p. 57; Hierac. Alp. franç. (1888) p. 24; *H. tomentellum* N. P., Monogr. II (1886—1889

p. 79; = **lanatum** < **glaucum** Zahn, in Hierac. d. Schweiz (1906) p. 335; *glaucum-tomentosum* N. P. l. c.

Caulis 25—35 (cult. ad 45) cm altus gracilis, saepe subfractiflexus, striatus, saepissime usque ad basin ramosus, phyllopodus. Folia rosularia ad 10 evoluta v. minus numerosa sat magna lanceolata, basin versus sensim attenuata vix petiolata, acuta, remote acutidentata, glaucescentia tenuia; caulina c. 3—5, inferiora lanceolata sessilia, superiora cito decrescentia anguste lanceolata interdum fere integerrima. Inflorescentia furcata subsquarrosa (2—) 6—12 cephalae; acladium 30—90 mm longum, rami primarii (1—) 2—5 valde remoti oblique erecti graciles, apice haud incrassati, ordines axium 3. Involucrum 12—14 mm longum globosum; squamae latiusculae acutae, interiores apice obtusiusculae, obscurae late diluteque marginatae. Bractee in acladio 2—3 subulatae 5 mm et longiores. Pili in tota planta diluti sericei, in involucrio densi, 2 mm, in caulomatibus superne (1—1,5 mm) et inferne (2—3 mm) sat densi, in medio minus numerosi, in foliis supra sparsi v. subnumerosi, in margine subtusque sat numerosi, 1 mm, in nervo dorsali numerosi, 3—4 mm, distincte basin versus longius denticulati. Glandulae nullae v. in squamis et in apicibus pedunculorum valde solitariae. Flocci in squamarum marginibus densi, pedunculi superne dense floccosi v. subfloccosi, in caulomatibus fere nulli v. caulis basin versus dispersi, folia in nervo dorsali tantum disperse floccosa. Flores lutei, stylus initio luteus, denique obscurus, ligulae apice glabrae; achaenia atra, 3,5 mm longa.

Hab. Pedemontium: Prope Limone (Naegeli!), Bagni di Vinadio (Burnati!) et in valle Cogne pr. Aosta (Naegeli).

Exsiccata: Hieracia Naegeliana no. 343.

(1906) p. 353.

Caulis 20—45 cm altus gracilis flexuosus, pilis sat densis densisve 3—5 mm longis horizontaliter patentibus obsitus, superne saepe subfloccosus. Folia rosularia subnumerosa sat magna \pm petiolata \pm lanceolata obtusa v. acuta, denticulata v. sinuato-dentata v. dentibus nonnullis grossioribus praedita, saepissime glauca, in nervo dorsali basin versus et in caulis basi saepissime violacea, supra \pm glabrescentia v. fere mediocriter \pm rigidiusculeque pilosa, 2—3 mm; caulina 3—8 sensim, vel in plantis humilioribus citius decrescentia, ima radicalibus similia subpetiolata, superiora basi rotundata v. basi subcordiformia sessilia, saepe e basi late ovata acuminata. Inflorescentia furcata \pm squarrosa, acladium $\frac{1}{5}$ — $\frac{1}{3}$ totius caulis exhibens, rami primarii 1—2 (—3) remoti graciles arcuato-erecti monocephali vel simpliciter ramosi, capitula (1—) 2—3 (—6). Involucrum 12—17 mm longum magnum denique late ventricosum-globosum; squamae exteriores saepe angustiores sublaxae v. laxae, interiores latiores v. lanceolatae, omnes \pm acutae v. longe acuminatae acutissimae, atrovirides v. subvirides, saepissime dilutius marginatae. Bractee 3—5 foliaceae. Pili in involucrio densi diluti 2—4 mm longi, in pedunculis mediocriter numerosi v. densi. Glandulae involucri dispersae minutissimae, in pedunculis superne tantum valde solitariae, in foliis ubique nullae v. soli-

tariae minutaeque. Involucrum effloccosum, pedunculi modice floccosi v. tomentosi. Flores lutei, ligulae apice glabrae rarius breviter ciliatae, stylus saepissime luteus, achaenia dilute brunnea, c. 4 mm longa.

Hab. in Helvetia: Jura, Waadt, Wallis, Freiburg, Glarus, Appenzell, Zürich, Graubünden, Tessin; Carinthia; Stiria. Fere semper in consortio *H. humilis* ad radices rupium.

1. Folia supra mediocriter sat denseve pilosa.

Subspecies **cryptadenum** A.-T. l. c. — Folia rosularia sat magna late lanceolata acuta mucronataque, longe attenuata basi subpetioliformia, remote denticulata v. dentata, in margine glandulis dispersis minutis obsita. Involucrum globosum, squamae angustae acutissimae. Capitula 2—3. Tota planta ubique sat dense pilosa, 2—4 mm. Habitu *H. dentati* capitulis *H. villosi* similibus.

Helvetia: In rupibus ad lacum Kloentalersee 900 m (Bruegger); ad rupes silvaticas m. Ornberg pr. montem Bachtel supra viam inter Wernetshausen et Wald 800 m (Benz); in faucibus m. Schnebelhorn: prope Baerloch (Schulthess), in fauce Fruehtobel 950—1000 m (O. Naegeli); inter Baerloch et Ragenbuch 1045 m, inter Baerloch et Strahlegg (O. Naegeli), in faucibus Vorderschuertobel 920 m, Baurenbodenschlucht 950 m (O. Naegeli), Leutobel 920 m, Vordere Töss versus Hüttkopf 880 m (idem); in vallecula Bruelltobel pr. Appenzell (Sulger). Flora Valdostana: Dondena all' Echelette in valle Champorcher 1700 m (Vaccari).

Planta rarissima et eximia, praesertim in valleculis circum m. Schnebelhorn ad orientem oppidi Turici ab O. Naegeli lecta. In consortio huius subspeciei hinc inde crescit *H. humile* Jacq. v. huius subspecies lacerum Reut., sed *H. villosum* omnino deest v. crescit locis distantibus elatioribus. Ex mea sententia *H. cryptadenum* relictum ex ultima periodo glaciali est.

Tab. 123, Fig. B. 4, 5. *H. Kernerii* Zahn ssp. *kerneriforme* Zahn (e iugo Col de la Croix, leg. Muret). 4. Squama. 5. Pedunculus sub involucri.

Subspecies **lavacense** Murr et Zahn, in Koch Syn. (1901) p. 1837. Caulis 35 cm altus tenuis superne breviter pilosus effloccosus. Folia radicalia numerosa sat longe petiolata ovata v. ovato- v. elliptico- v. triangulariter lanceolata obtusa v. plerique \pm acuta basi truncata (exteriora interdum subcordata) vel intima (saepe inaequaliter) in petiolum brevius longius attenuata et acutiora, omnia praecipue basin versus inaequaliter grosseque vel lobato-dentata, utrimque disperse breviterque pilosa v. supra fere glabra, in margine sat dense pilosa et sparsim glandulosa, in petiolo albo-subvillosa; caulina 1—2 lanceolata subpetiolata, in nervo dorsali subfloccosa summum saepissime lineare. Acladium 2—5 cm v. ad $\frac{2}{3}$ totius caulis exhibens, rami primarii 1 (—2), capitula 2 (—4). Involucrum 12—13 mm longum denique crasse ovatum, squamae subnigrae acutae sat dense pilosae disperse glandulosae floccosaeque, pedunculi sat dense pilosi subglandulosi disperse floccosi.

Hab. in Tirolia boreali: In iugo Lavatsch prope Hall (det. J. Murr).

Tab. 124. *H. Kernerii* Zahn ssp. *lavacense* Murr et Zahn (e loco class., leg. J. Murr).

1. Dentes ligularum. 2. Squama. 3. Pedunculus sub involucri. 4. Nervus dorsalis foliorum. 5. Margo foliorum.

Subspecies **abbatiscellanum** Dutoit, apud Zahn in Koch Synops. (1901) p. 1838, Hierac. d. Schw. (1906) p. 370; *H. lacerum*—*senile* Zahn l. c. Caulis 15—20 cm altus valde flexuosus, saepissime haud foliatus, usque ad basin floccosus et pilis albis 1—3 mm longis subpilosus. Folia rosularia 4—8 sordide viridia, exteriora minora elliptica v. obovata dentata, interiora ovato-lanceolata vel angustiora acuminata, basi lobato-dentata subpinnatifida, dentibus saepe in petiolum descendentibus, utrimque subrigidiuscule pilosa, in margine nervoque dorsali pariter ac in petiolo subvillosa, 3 mm, et glandulis subnullis obsita. Acladium 2 cm v. ad $\frac{1}{2}$ totius caulis exhibens, rami primarii 1—2, capitula 2—3. Involucrum 9—10 mm longum, squamae angustissimae acutae mediocriter v. sat dense pilosae, 1—2 mm, disperse glandulosae. Pedunculi consimiles.

Helvetia orientalis: Inter alpem Meglisalp et montem Saentis, 16—1700 m, Abbatiscellae (Dutoit); in declivitatibus Pischavallis Heutal Berninae (Ruebel et Braun).

Hieracio senili A. Kerner haud dissimile et sine dubio intermedium inter *H. incisum* (vel *psammogenes*) et *H. lacerum*, quocum crescit.

Tab. 125, Fig. A. 1—3. *H. Kernerii* Zahn ssp. *abbatiscellanum* Dutoit (e m. Saentis, leg. Dutoit). 1. Squama. 2. Pedunculus sub involucri. 3. Caulis portio.

Subspecies **raccolanae** Zahn in litt. et apud Benz, in Oesterr. bot. Zeitschr. (1904) no. 7 (sub *H. inciso*). Caulis 15—35 cm altus flexuosus gracilis, superne subpilosus et sat dense floccosus, basin versus densius longiusque pilosus, pilis 2,5—4,5 mm longis \pm patentibus, fere effloccosus \pm violaceus. Folia rosularia subnumerosa brevius longiusve petiolata ovato-lanceolata v. lanceolata utrimque attenuata \pm acuminata, denticulata v. grosse dentata, exteriora minora latiora minus acuta obtusave, omnia utrimque subpilosa, in margine nervoque dorsali pariter ac in petiolo pilis 2,5—4,5 mm longis sat dense pilosa et glandulis parum numerosis minutis obsita; caulina 1—2 (—3), inferius lanceolatum irregulariter grosseque dentatum longe acuminatum, reliqua lineari-lanceolata v. linearia saepe integerrima longius acuminata. Inflorescentia furcata, acladium 4—10 cm longum, rami primarii 1—2 (—3) erecti v. inferiores 1—2 oblique patentes, ordines axium 2—3, capitula (1—) 3—7 (—10). Involucrum 10—12,5 mm longum globoso-ovatum, squamae subangustae longe acuminatae acutae obscurae anguste viridi-marginatae subfloccosae subpilosae, 2—3 mm, disperse glandulosae. Pedunculi dense floccosi subpilosi superne disperse glandulosi. Flores sat magni lutei.

Carinthia: In iugo Ploeken (R. de Benz); Italia superior: in valle Raccolana pr. Chiusaforte (Pospichal).

Tab. 125, Fig. B. 4, 5. *H. Kernerii* Zahn ssp. *raccolanae* Zahn (e valle Raccolana, leg. Pospichal). 4. Squama. 5. Pedunculus sub involucri.

80. Hieracium Braunianum Chen. et Zahn, in Chenevard et Braun, Contrib. fl. Tessin (Annuaire jard. bot. Genève 1905) p. 52 et in Zahn, Hierac. d. Schw. (1906) p. 370; = **humile**—**subspeciosum** Zahn l. c.

Caulis 10—30 cm altus tenuis v. gracilis inferne violaceus. Folia rosularia subnumerosa brevius longiusve petiolata late angustave lanceolata, utrimque breviter longeve attenuata, acutiuscula v. acuta, dentata v. serrato-dentata, subglaucescentia dilute v. sordide viridia saepe sublutescentia; caulina 2—7 lanceolata v. superiora linearia, infima basi angustata sessilia, superiora basi aequilata v. rotundata sessilia. Inflorescentia furcata. Acladium c. 5—7 cm longum, rami primarii 0—3 valde remoti monocephali v. simpliciter ramosi,

capitula (1—) 2—5 (—7), involucrium 10—11 mm longum crassum ovatum denique late depressum, squamae subangustae acuminatae acutiusculae et acutae, exteriores angustiores, omnes subatrae, exteriores in margine subcanofloccosae, interiores viridi-marginatae. Bractee 2—5. Pili in involucrio subnumerosi 1—1,5 mm longi, in pedunculis subnumerosi v. dispersi, caulis disperse v. modice v. inferne dense pilosus, 1—2 mm, folia supra epilosa v. subpilosa, in margine subtusque densius pilosa. Glandulae in involucrio dispersae v. mediocriter numerosae, in pedunculis sparsae, in caule subnullae, in foliorum margine nervoque dorsali sparsae minutissimae. Flocci in involucrio mediocriter numerosi v. (in squamarum marginibus) densissimi, pedunculi superne can, caulis usque ad basin deminute floccosus. Flores saturate lutei, ligulae apice glabrae v. inconspicue ciliatae, stylus luteus, achaenia obscure brunnea.

Habitat in Pedemontio, in Helvetia australi et orientali. — Flor. Iul.-Aug.

Subspecies **Braunianum** Chen. et Zahn l. c. Folia rosularia exteriora minora saepe obovata, interiora magna (ad 15 cm longa) late, intima anguste lanceolata, omnia in petiolum brevem late alatum sensim angustata, caulina anguste lanceolata v. linearia valde elongata acutissima in nervo dorsali subfloccosa; omnia dilute viridia subglaucescentia grosse serrato-dentata supra ± glabra. Bractee 2—3 subulatae. Squamae (ut pedunculi) subglandulosae, glandulis sat magnis obscuris, in margine subcanotomentosae. Caulis disperse pilosus, folia in nervo dorsali pilis ad 3 mm longis submolliibus obsita. Ligulae apice glabrae.

Helvetia australis: In alpe Robiei 1800 m et in valle Peccia: Inter La Corte almetto et alpem Zotta 19—2000 m (J. Braun).

Haec subspecies verosimiliter intermedia est inter *H. humile* et *H. subspeciosum* ssp. *patulum* N. P.

Tab. 126. *H. Braunianum* Chen. et Zahn (e valle Peccia, leg. Braun). 1. Squama. 2. Pedunculus sub involucrio. 3. Dentes ligularum. 4. Foliorum margo.

In Hierac. d. Schweiz p. 371 et 372 duas alias subspecies descripsi: Ssp. **lillense** Zahn et ssp. **Ruebelianum** Zahn. Prima habitu *H. inclinati* Arv.-T. pilositatem *H. humilis* prae se fert et *H. Gremlii* Arv.-Touvet facile in mentem revocat, sed ab hac subspecie totius plantae pilis brevibus et foliis in margine nervoque dorsali disperse minuteque glandulosis differt. Habitat inter Lillaz et Crêt 17—2000 m in valle Cogne Pedemontii (Vaccari). — Secunda subspecies *Ruebelianum* habitu *H. oxyodontis* Fries rupes calcareas m. Piz Alv 2300 m Berninae in consortio *H. laceri* Reuter inhabitat, quo ex loco cl. Schroeter et Ruebel exemplaria nonnulla una cum numerosiore messe *H. laceri* et *oxyodontis* apportaverunt. Ab *H. oxyodonti* praecipue foliis in margine nervoque dorsali pariter ac in petiolis glandulis subnullis minutis praeditis differt.

81. Hieracium lانسicum A.-T. et Ravaut 1873, Monogr. (1873) p. 37; Hierac. alp. franç. (1888) p. 58; N. P., Hierac. Mittel-Europ. II (1886—1889) p. 319; *H. Jacquini*—*andryaloides* A.-T. l. c.; *H. Lanseanum* A.-T., Essai Suppl. (1872) p. 12; = **lanatum** > **humile** Zahn; *tomentosum* > **humile** N. P. l. c.

Phyllopodum, v. hypophyllopodum canoviride, ubique laxe sublanato-pilosum. Caulis 20—40 cm altus erectus crassiusculus flexuosus distincte striatus saepe usque ad basin ramosus. Folia radicalia florendi tempore emarcida v. 1—3 evoluta longe petiolata ovata v. elliptica v. oblonga basi subtruncata v. saepius in petiolum angustata, basin ± grosse

irregulariterque dentata v. sinuato-lobata, dentibus mucronatis, apicem versus tantum denticulata, obtusa v. breviter acuta, tenuia, lutescenti-viridia; caulina 2—5 sensim decrescentia \pm remota, infima alato-subpetiolata oblonga v. oblongo-lanceolata v. triangulariter lanceolata, media basi angustata sessilia v. e basi ovata oblonga v. ovato-lanceolata brevius longiusve acuminata, omnia sat magna irregulariter serrato-dentata sublobata, summa lanceolata v. linearia acuta, in bracteas inflorescentiae decrescentia. Inflorescentia altefurcata v. laxe panniculata indeterminata, acladium 3,5—6 cm ($-\frac{1}{2}$ totius caulis) exhibens, rami primarii 1—5 ($-\frac{1}{2}$) remoti crassiusculi oblique erecti v. oblique patentes saepe flexuosi, ordines axium 3, capitula (1—) 3—10 ($-\frac{1}{2}$). Involucrum 13—14 mm longum sat magnum globosum, squamae latae lanceolatae acutiusculae subatrae viridi-submarginatae, exteriores obtusiusculae saepe in bracteas descendentes. Pili plumosi diluti molles, in involucrio densissimi 2—2,5 mm longi, caulomata \pm dense pilosa, 1—1,5 mm, folia utrimque dense pilosa, 1,5—2 mm, in nervo dorsali petioloque etiam densius pilosa, 3—4 mm. Glandulae in involucrio dispersae, in pedunculis dispersae v. subnullae, folia praecipue in margine petioloque glandulis minutis aegre observandis praedita. Flocci in involucrio foliisque nulli, caulomata superne tomentosa, deorsum sensim deminute floccosa. Flores lutei, dentes ligularum ciliati, stylus initio subluteus denique \pm obscurus, achaenia subatra.

In rupibus calcareis et molassicis Delphinatus. — Flor. Iul.

Variat: $\alphagenuinum A.-T., Hierac. alp. franç. (1888) p. 58. Phyllopodium, folia caulina minus numerosa, squamae obtusiusculae v. subacutae, caulis humilior densius pilosus.$

β) **anserinum** Ravaud, apud A.-T., Monogr. (1873) p. 37; N. P., Hierac. Mittel-europ. II (1886—1889) p. 330; *H. Liottardi* Ravaud, Bull. Soc. bot. Fr. VII p. 741, sec. A.-T. l. c.; *H. sabaudum*—*andryaloides* ? A.-T. l. c.; *H. tomentosum*—*sabaudum* N. P. l. c. Hypophyllopodium, folia caulina numerosiora, squamae exteriores obtusiores, caulis elatior minus dense pilosus.

Inter Villard-de-Lans et Die: à Bréduire, sur les rochers de la Cascade; sur les flancs de la Roche-Pointue (Ravaud); rochers sur les bords de la Bourne; in rupibus molassicis prope Bard et Les Gorges, haud procul ab introitu ad Grands-Goulets; Col de l'Arc (A.-T.); Col de Braus (Herb. Univers. Lausanne); rochers de la scierie, route de Corrençon près Villard-de-Lans (Neyra).

Annotatio: Var. B. *doronicoides* A.-T., Monogr. p. 37; N. P. l. c. p. 319, foliis caulinis inferioribus mediisque petiolatis tenuibus mollissimis, est forma varietatis α ab A.-T. postea nullo loco commemorata. At contra hic auctor nomen *H. doronicoides*, in Hierac. nouv. Fr. Esp., Bull. Soc. bot. Fr. XLI (1894) p. 340, Hieracioth. Gallic. 181—187, speciei omnino diversae pyrenaicae ex affinitate *H. cerinthoidis* L. imposuit.

Exsiccata: Soc. franco-helvet. (1898) no. 868 (Chemin de Corrençon, leg. Nerya!).

Tab. 127. *H. lansicum* A.-T. (pr. Villard-de-Lans, leg. A.-T.). 1. Squama. 2. Pedunculus sub involucrio. 3. Pilus foliorum.

Annotatio: Existunt praeter *H. lansicum* etiam duae species inter *H. humile* et *H. lanatum* intermediae: 1) **H. Kochianum** Jord. = **humile** > **lanatum** iam in Reichb. Ic. XIX. 1 depictum, 2) **H. Reboudianum** A.-T., Suppl. à Monogr. (1876) p. 12; Hieracioth. Gall. no. 84!; Soc. franco-helv. no. 864!; = **andryaloides**—**humile** [Delphinatus: Sisteron (Basses-Alpes, leg. Loret); les Goulets aux Echevis dans les gorges de la Bourne (A.-T.); St.-Paul de Varcès, près du sentier du Col de l'Arc (Neyra); etc.]. Hae duae species habitu

H. humilis, praecipue indumento, in *H. Reboudiano* more *H. andryaloidis* tomentoso denso 1 mm tantum longo, in *H. Kochiano* laxissime pellito-piloso 2—3 mm longo, differunt.

Sectio XI. **Alpina** [Fries, Epicr. (1862) p. 42; Griseb., Comm. p. 28 p. p.; A.-T., Hierac. alp. franç. p. 41; Burnat et Gremli, Hierac. alp. mar. p. 17; Zahn, in Koch Syn. (1901) p. 1839; Hierac. d. Schw. (1906) p. 14; Stirps *H. pseudocerinthoidea* s. *H. alpini* Fr., Symb. (1848) p. 69; *Pseudocerinthoidea Alpina* A.-T., Essai classif. p. 7]. — Folia viridia v. sordide v. obscure viridia pilosa et glandulosa haud viscosa. Caulis simplex scapiformis v. profunde furcato-ramosus oligocephalus; folia caulina haud amplexicaulia, radicalia sensim in petiolum ± late alatum angustata saepissime elongata spathulataque. Involucrum plerumque ± magnum ± dense longeque pilosum, squamae saepe ± obtusiusculae. Dentes ligularum pilosi v. ciliati. Alveoli in margine dentati. Stylus luteus rarissime subobscurus. Rhizoma haud lanato-comosum.

Per zonam arcticam et subarcticam Europae, Asiae, et Americae, in montibus subalpinis Scandinaviae, Britanniae, Silesiae, Transsilvaniae et per omnium Alpium tractum Europae centralis, in Vogesis et in m. Bructero. — In Pyrenaeis, in albis Haemi et in Caucaso adhuc haud inventum. — Flor. Iul. Aug.

Dispositio gregum (Europae centralis):

- 1) Folia omnino *effloccosa* vel caulina superiora in margine nervoque dorsali tantum floccis pedunculatis apice stellatis parum numerosis obsita.
 - a) *Alpinum* Zahn, in Koch Syn. (1901) p. 1840. Folia rosularia obovata v. oblongo-lanceolata ± obtusa, interiora v. interdum omnia lanceolata v. linearia spathulata v. linearia valde elongata, omnia saepissime *integerrima*. Stylus semper luteus. — Ssp. *alpinum*, *gymnodon*, *nigrosetosum*, *melanocephalum*, grande.
 - b) *Tubulosum* Zahn l. c. p. 1841. Folia *gramineo-viridia* spathulata late v. anguste lanceolata ± elongata basin versus in petiolum saepissime latissime alatum sensim angustata, *denticulata rarissime dentata*. Stylus luteus v. saepius subobscurus. Planta robusta in Sudetis endemica. — Ssp. *tubulosum*.
 - c) *Halleri* Zahn l. c. p. 1841. Folia anguste lanceolata v. lanceolata saepe elongata aequilata, vel oblongo-lanceolata v. spathulata, saepissime ± *irregulariter grosse dentata*. Stylus luteus v. subobscurus. Plantae saepe robustae. — Ssp. *Halleri*, *calenduliflorum*.
 - 1* Folia in margine nervoque dorsali, caulina etiam in tota parte aversa vel utrimque distincte floccosa.
 - d) *Pseudofritzei* Zahn. Folia *gramineo-viridia* lanceolata *denticulata*; caulina ovato-lanceolata vel lanceolata. Stylus luteus v. subobscurus. — Ssp. *pseudofritzei*.
 - a) *Alpinum* Zahn.

Subspecies **alpinum** (L. l. c.). Caulis subtenuis v. gracilis 5—20 cm altus. Folia rosularia saepissime *integerrima* v. inconspicue *denticulata*. Involucrum *ovatum* v. *globoso-ovatum*, initio saepe basi turbinatum minus 15 mm longum, ligulis elongatis florendi tempore

discum planum formantibus, squamis subnumerosis. Glandulae in tota planta saepissime breves. Ligulae apice pilosae.

Variat: *αgenuinum, involucris globoso-ovatis ad 15 mm longis, caulibus elatioribus gracilibus plerumque 1—2 (—3) foliatis.*

1) normale Zahn, Hierac. d. Schw. (1906) p. 374; indumento canescenti (pilis basi tantum atris).

a) *vulgare* Tausch, in Flora (1828), Erg.-Bl. I p. 63; foliis intergerrimis obovato- v. ovato-spathulatis haud ita longe petiolatis. — In Sudetis, in montibus Carpatho-Transsilvanicis et in Alpibus haud infrequens.

b) *angustifolium* Tausch l. c.; foliis integerrimis lanceolato- v. lineari-spathulatis saepe longe longissimeve petiolatis. — Praecipue in Sudetis et in montibus Carpatho-Transsilvanicis.

c) *squamosum* Tausch l. c.; scapis superne bracteis linearibus foliosis dense obsitis. — In summis pratis montium Riesengebirge (Tausch!).

d) *subfoliosum* Zahn, in Koch Syn. (1901) p. 1840; foliis caulinis saepe ad 3 evolutis saepe subdenticulatis maioribus, squamis externis haud raro ± foliaceis, foliis radicalibus saepe florendi tempore partim emarcidis. — Locis ± dense graminosis Alpium.

2) villosissimum Tausch l. c. (1828); *albovillosum* Froel., in DC., Prodr. VII (1838) p. 208; *H. alpinum* v. *barbatum* Wahlbg., Fl. Carp. no. 784 (1814) p. p. ? ; *H. holosericeum* Backh., Mon. Brit. Hierac. (1856) p. 19. Indumento pilis longis albo-sericeis ± permixto v. pilis albo-sericeis praevalentibus, foliis plerumque integerrimis.

a) *albovillosum* Froel. l. c.; foliis ovato- v. lanceolato-spathulatis, squamis dense pilosis, exterioribus obtusiusculis, interioribus acutis. — In Sudetis orientalibus, in montibus Tatra, in Vogesis Alpibusque. Etiam in montibus Britanniae, Scandinaviae et in Rossia arctica usque ad Sibiriam.

b) *pseudocapnoides* Zahn, in Koch Syn. (1901) p. 1840; foliis longissimis anguste lanceolatis apice ± spathulatis, squamis longe acuminatis acutis v. acutissimis, caulibus robustioribus, involucris crasse globoso-ovatis saepe plus 15 mm longis pariter ac caules dense longeque albo-villosis. — In Alpibus tantum obvium: Val Avers, Val Fex, Val Zeznina, Piz Lagalp et in iugo Spluegen Helvetiae orientalis (Kaeser, Touton, Bernoulli, Schroeter, Zahn); Tirolia: Tristen pr. Weissenbach 2400 m (Treffer); Salisburgia: Tweng 1400 m (Fest); Helvetia occidentalis: Grd. St.-Bernard 2200 m (Besse); Italia borealis: Macugnaga (Chenevard).

3) subpilosum Zahn; indumento abbreviato multo minus denso vel (in foliis) subnullo.

a) *brevipilum* Zahn, pilis ubique brevibus in caule superne dispersis, capitulis haud villosis, squamis inter pilos laxos conspicue glandulosis. — In m. Babia Gora (de Degen) et in montibus Carpatho-Transsilvanicis.

- b) *calvifolium* Zahn, foliis subviridibus epilosis (sed ubique tenuiter glandulosis!) in margine nervoque dorsali subciliatis, capitulis breviter subvillosis. — Transsilvania: In m. Vurfu Pelaga (Retyezat), leg. A. de Degen; in m. Zeyritzkampel pr. Kalwang, Stiriae sup. (de Benz).
- 4) *tubuliflorum* Zahn, Hier. d. Schw. (1906) p. 375; *tubulosum* Auct., nec Tausch. Plantae elatae vel humiles, floribus ± tubulosis.
- a) *verum*, ligulis elongatis semitubulosis v. tubulosis, stylis fere inextertis. — In Alpibus Helvetiae et Tiroliae haud ita rarum.
- b) *stylosum* G. Schneid., Oesterr. bot. Zeitschr. (1887) p. 199; *H. alpinum* v. *tubulosum* Schleich. in sched. et Gaudin, Fl. Helv. V p. 67; ligulis tubulosis abbreviatis, stylis longe ex tubo exsertis. — Helvetia: Gorges d'Alesse (Schleich.); in m. Koppenplan Sudetorum et in valle Kupferschaechten superiore Tatrae (G. Schneider). Forma rarissima esse videtur.
- β) *pumilum* Hoppe, apud Willd., Sp. pl. III (1804) p. 1562; Hoppe Exs.; Sturm, Heft 37 tab. 4 [nec Jacq., Fl. Austr. II (1775) p. 53, tab. 189 = *H. humile* Jacq. 1776]. Involucris ovatis minoribus, caulibus humilibus subtenuibusque plerumque haud foliatis. — Formae pascuorum aridorum v. altissimorum.
- 1) normale, indumento canescente v. dilutiore.
- a) *verum*, foliis sat parvis obovato- v. oblongo-spathulatis saepe uno alterove dente ± distincto munitis. — Helvetia, Tirolia, Algovia, Salisburgia, Carinthia, Stiria, in Sudetis et in Alpibus Carpatho-Transsilvanicis.
- b) *canescens* Froel., in DC. Prodr. VII (1838) p. 208; *gracilentum* A.-T., Hier. Alp. franç. (1888) p. 42; nec Backh., Mon. Brit. Hierac. (1856) p. 19 et Fries, Epier. (1862) p. 44; var. *pseudopiliferum* A.-T. in sched. Pauca cm tantum altum, folia ± linearia dense pilosa, indumentum saepe dilutum, habitus haud raro ut in *H. pilifero*. — In summis iugis Alpium.
- c) *brevipilum*, indumento abbreviato minus denso v. (in foliis exterioribus) subnullo. — In Alpibus Carpatho-Transsilvanicis et Stiriae superioris.
- Formas tubulosas et stylosas vide sub α 4.
- 2) *setulosum* G. Schneid. l. c. Pilis in involucri cauleque nigrosetosis ubique 0,5—1 mm tantum longis, caule superne nigroglanduloso, squamis atris. — In montibus Riesengebirge: Schneekoppe, Weisse Wiese, Grosser Kessel (G. Schneider).

Subspecies ***gymnodon*** Zahn, nov. ssp. — Caulis 10—12 cm altus subtenuis flexuosus distincte striatus, pilis canescentibus basi atris 2—3 mm longis subdensis, glandulis subnumerosis tenellis sat brevibus brevissimis intermixtis, apicem versus floccis subdensis v. densis deorsum subcito deminutis basin versus dispersis obsitis, monocephalus. Folia radicalia numerosa rigidiuscula *gramineo-viridia*, mediocriter, marginem versus densius pilosa, pilis rigidiusculis 2—3 (—4) mm longis, ubique mediocriter subtiliterque glandulosa efflocosa, omnia denticulata, dentibus subnumerosis, exteriora lanceolato-spathulata obtusa,

pleraque lanceolata v. anguste lanceolata in petiolum late v. latissime alatum sensim attenuata apice subacuta v. acuta saepe \pm plicata; caulina 1—3 anguste lanceolata denticulata v. summa linearia subintegerrima in margine subfloccosa. Involucrum ovatum 10,5—12 mm longum, squamae obscurae subangustae, acutae v. interiores acutissimae, apice haud barbulate, glandulis brevibus numerosis pilisque satis densis ad 2 mm longis obsitae haud villosae effloccosae. Ligulae partim subtubulosae partim evolutae dilute luteae apicem versus parum pilosae, dentibus haud pilosis, plerumque tantum granulatis, rarissime subciliatis. Stylus luteus, achaenia castanea.

Hab. locis graminosis m. Huehnerkar pr. Wald Stiriae superioris, leg. E. Khek.

Verosimiliter inter ssp. *alpinum* et ssp. *pseudofritzei* intermedium, sed ligularum dentibus fere glabris insigne.

Subspecies **nigrosetosum** G. Schneid., Oest. bot. Zeitschr. (1887) p. 199; Hier. d. Westsudeteten [in „Das Riesengebirge in Wort und Bild“, Heft 38 et 39 (1891)] p. 33 et in Sag. et Schneid., Fl. Centralkarpath. (1891) II p. 324. Habitus et characteres principales ut in ssp. *alpino*, sed indumento obscuriore et foliis \pm dentatis differt. Caulis rectus, sursum setis longis nigris \pm copiosis indumento villosio immixtis, basin versus pilis obscuris basi atris obsitus, apice praeter glandulas breves glandulis dispersis maioribus adpersus. Folia basilaria spathulata \pm dentata, caulina 2—3 saepe basin versus dentata. Squamae aterrimae. Ligulae apice pilosae.

Hab. in m. Brunnberg Sudetorum 1450 m (Schneider) et in montibus Tatra: Polnische Fünfseen (Sagorski).

Verosimiliter inter ssp. *alpinum* et *H. Fritzei* ssp. *spathulifolioides* Zahn (*spathulifolium* G. Schneid., Oestr. bot. Zeitschr. 1887 p. 274, nec Vukot.) intermedium.

Subspecies **melanocephalum** Tausch, in Flora (1828) Erg.-Bl. I p. 63; ibidem (1837) Erg.-Bl. I p. 67; *H. alpinum* var. *nigricans* et *Halleri* Tausch l. c.; var. *macrocephalum* Tsch. Exs.! *H. atricapillum* Hoppe, apud Tsch. l. c.; *H. Czereianum* Baumg., Enum. Transsylv. III (1816) p. 20 apud Neilr., Krit. Zus. Hierac. (1871) p. 40. Caulis ad 30 cm altus saepe rectus crassiusculus raro gracilis v. humilis. Folia rosularia saepe dentata v. denticulata, caulina 1—3, superiora saepe parva. Involucra 14—18 mm longa globosa v. ventricosa denique saepe ate depressa et basi truncata, squamae numerosae, ligulae haud elongatae numerosissimae saepe paulo breviores v. paulo longiores quam involucrum, florendi tempore discum excavatum formantes. Ligulae apice pilosae.

Hab. in Alpibus Helveticis, Bavaricis, Austriacis, in Sudetis et in montibus Carpatho-Transsilvanicis, in m. Bructero.

Variat: $\alphagenuinum, folii spaucidenticulatis vel paucidentatis v. integerrimis, caulinis integerrimis.$

1) normale G. Schneid., Oester. bot. Zeitschr. (1887) p. 199. Indumento canescenti, setis nigris saepe permixto.

a) *angustifolium*, foliis anguste lanceolatis apice spathulatis saepissime elongatis in petiolum longissime angustatis, plerumque sat dense pilosis. — Rhaetia: In iugo Spluegen (Zahn), Engadina: Albula, Val Bevers, Muottas Muraigl (Candr.), Val Zeznina 2300 m (Bernoulli); Tirolia: Riedberg et Platzerberg pr. Gossensass (Murr, Oborny), inter iuga Sella et Rodella (Tout.); Stiria: Turracher Höhe, Diesingsee

(Fest), Hühnerkar pr. Wald (Khek), Voistaler Hütte 1700 m in m. Hochschwab (Nevole); frequenter in Sudetis et in montibus Carpatho-Transsilvanicis.

- b) *spathulatum*, foliis obovato- v. oblongo-spathulatis in petiolum \pm cito angustatis, exterioribus saepe calvescentibus. — Helvetia, Tirolia borealis et australis, Stiria, Bavaria australis, Salisburgia, Carinthia, a Silesia usque ad Transsilvaniam.

Interdum humile, caule subunifolio, sed involucris late depressis, floribus haud elongatis a formis var. *pumili* distinguitur.

- c) *squamosum*, caule sursum squamis subnumeris linearibus \pm foliaceis obsito. — In m. Babia gora (de Degen) et in montibus Riesengebirge (Tausch!).

- 2) *sericeum* G. Schneid. l. c. Indumento pilis albo-sericeis permixto v. pilis albosericeis praevalentibus, involucro 16—17 mm longo. — Tatra: Kriván, Késmarker Gruensee, Grosses Kohlbachtal (Sagorski), in Sudetis 13—1550 m et in Stiria superiore. In Alpihus Rhaeticis haud typicum.

- 3) *pilosissimum* Zahn. Involucro dense obscureque villosa, caule densissime, superne obscure piloso, pilis 5—8 mm longis. — In m. Bructero.

- 4) *brevipilum*, indumento abbreviato saepe minus denso.

- a) *verum*, pilis subnumeris brevibus mollioribusque. — Cum forma principali.

- b) *nivale* Velen., Oestr. bot. Zeitschr. (1883) p. 388; G. Schneid., Hierac. Westsud. l. c. p. 32; *setulosum* G. Schneid., Oestr. bot. Zeitschr. (1887) p. 199. Pili 0,5—1 mm longi nigrosetosi, involucrum 17—18 mm longum, squamis atris. — In Sudetis: Supra Grosse Schneegrube, Weisse Wiese, Schneekoppe (G. Schneider).

- c) *calvescens*, foliis epilosis v. praecipue interioribus subciliatis, caule brevipilo, involucris breviter subvillosis. — Babia gora et in m. Galațiu pr. Rodna Transsilvaniae (de Degen).

- 5) *tubuliferum*, ligulis tubulosis.

- a) *tubulosum*, stylis non v. paulum ex tubo exsertis. — Helvetia orient: p. e. in iugo Spluegen (Zahn); Tirolia: in m. Platzerberg p. Gossensass (Murr) etc.; Stiria sup.: Trattenbauernalpe pr. Krakau-ebene (Fest). — Haec forma quasi intermedia inter ssp. *alpinum* et ssp. *Halleri* est.

- b) *stylosum* G. Schneid., Hierac. Westsudeten l. c.; Wimm. et Grab. ex p. Involucrum ca. 15 mm longum, styli longe ex tubo exserti. — Adhuc in Sudetis tantum observatum: Koppenplan, Langer Grund 1200 m (G. Schneid.).

- β) *aterrimum* G. Schneid., Oesterr. bot. Zeitschr. (1887) p. 200. Indumento obscuro, setis nigris permixto, in involucris denso. Caulis apice glandulis maioribus adspersus et dense pilosus, usque ad basin pilis basi atris obsitus. Folia saepe dentata. Squamae aterrimae. — In Sudetis: Brunnberg, Ziegen-

rücken, Seiffenberg (G. Schneid.); Tatra: infra lacum Késmarker Gruensee (Sagorski).

γ) **intermedium** A.-T., apud Murr, Deutsche bot. Monatsschr. (1897) p. 272; Zahn, Hierac. d. Schw. (1906) p. 376. Folia rosularia lanceolata v. angustiora saepe ± aequilata v. basin versus in petiolum latissime alatum angustata, denticulata v. dentata; caulina 1—3, inferiora elongata. Involucrum crassum haud ita dense pilosum, squamis latiusculis. Caulis 25—30 cm altus, superne glandulis maioribus obsitus.

1) normale, ligulis evolutis. — Helvetia: St.-Bernhard, Val Piora, Bernhardin, Oberalp, Val Avers, Val Fex, in valle Weisstannen; Tirolia: In m. Gavardina vallis di Ledro (Porta) etc.

2) subtubulosum, ligulis tubulosis v. semitubulosis. — Cum forma normali.

Haec variatio transitum inter ssp. *melanocephalum* et ssp. *Halleri* sistit et interdum a ssp. *Halleri* formis ligulis ligulatis praeditis aegre separanda est.

Tab. 129, Fig. A. 1—4. *H. alpinum* L. ssp. *melanocephalum* Tsch. (e m. Kiesberg Sudetorum, leg. Sagorski). 1. Dentes ligularum. 2. Squama. 3. Pedunculus sub involucro. 4. Foliorum margo.

Subspecies **grande** Wimm., Fl. v. Schlesien ed. 3 (1857) p. 306; *H. alpinum* var. Wimm. l. c. Caulis 20—30 cm altus crassiusculus, plerumque rectus, dense longeque pilosus, indumento canescenti, praecipue apicem versus glandulis subnumeris setisque nigris basi crassis immixtis, monocephalus. Folia rosularia sat magna ad 1,5 cm longa, numerosa, subviridia, lanceolata v. spatulata v. lingulata, obtusa v. acuta, denticulata v. dentata, interdum dentibus nonnullis grossis munita, rarius integerrima, mediocriter sat denseve pilosa minuteque glandulosa, rigidiuscula; caulina 2—4 (rarissime ad 7) lanceolato-spatulata v. linearia subpetiolata v. basi angustata sessilia saepe denticulata, summum plerumque bracteiforme. Involucrum 17—18 (—19) mm longum magnum semiglobosum denique late depressum basi saepe truncatum, squamis lanceolatis obtusiusculis plerumque acutis v. (intimis) acutissimis dense pilosis tenuiter glandulosis effloccosis, ligulis lingulatis apice breviter pilosis.

Adhuc in Sudetis occidentalibus et in m. Isergebirge tantum inventum, (800—) 1250—1450 (—1605) m.

Variat: 1) normale G. Schneid., Oesterr. bot. Zeitschr. (1887) p. 201, indumento canescenti, pilis basi tantum atris.

a) *verum*, indumento elongato. — Riesengebirge etc.

b) *brevipilum*, indumento in involucris caulibusque abbreviato. — Wiesenbaude (A. Schultz).

2) *sericeum* G. Schneid. l. c., indumento ± albosericeo. — Seiffenberg, Koppenplan, Kiesberg.

Haec subspecies exacte inter ssp. *melanocephalum* et ssp. *calenduliflorum* intermedia est.

b) *Tubulosum* Zahn.

Subspecies **tubulosum** Tausch, in Flora (1828) Erg.-Bl. I p. 63; ibidem (1837) Beibl. p. 68; nec Gaudin; *H. alpinum* γ) inapertum Wimm., Fl. Schles. ed. 2; *H. hebetatum* Wimm. ex p. Caulis (8—) 15—25 (—40) cm altus crassiusculus v. crassus erectus v. subascendens ± distincte v. subanguloso-striatus, ubique dense pilosus, pilis ± canescentibus v. dilutioribus 3—6 (—8) mm longis, apicem caulis versus basi crassiuscula nigris, rarius

± calvenscens, superne dense v. mediocriter longeque glandulosus et densissime floccosus, deorsum usque ad basin subglandulosus subfloccosusque. Folia gramineo-viridia submollia, utrimque et praecipue in margine sat dense pilosa, pilis mollibus basi incrassatis 2—3 mm longis, mediocriter tenuiterque glandulosa, radicalia ± numerosa, exteriora plerumque emarcida obovata, in petiolum late alatum sensim angustata, interiora spathulato- v. late v. anguste lanceolata late longeque alato-petiolata v. sensim attenuata breviter petiolata, apice obtusa saepe plicata mucronata, raro lineari-lanceolata acuta, inconspicue subsinuato- v. undulato-sinuato-, raro profundius dentata v. dentibus nonnullis grossioribus praedita; caulina (1—) 2—3 (—5) plerumque oblongo- v. lineari-lanceolata, basin versus angustata sessilia denticulata v. dentata, summa saepius integerrima. Inflorescentia plerumque monocephala, interdum furcata 2— (rarissime 3—) cephalis, ramis 1—2 erectis v. subarcuato-erectis dense pilosis mediocriter glandulosis superne dense, inferne mediocriter floccosis monocephalis, e foliorum caulinarum alis exserentibus. Involucrum (13—) 15—16 (—19) mm longum ovatum v. semiglobosum denique late depressum basi saepe ± truncatum, dense pilosum, pilis basi nigris apice canescentibus 3—6 mm longis, mediocriter minuteque glandulosum, effloccosum; squamae heteromorphae, latae v. latiusculae apice ± barbulate, exteriores obtusae v. acutiusculae obscurae v. atrovirides haud marginatae, interdum foliaceae virides, interiores acutiusculae v. acutae, v. dilute virides late diluteque viridi-marginatae, vel obscurae. Flores aureo-lutei, ligulae plerumque involutae tubuliformes, dentibus longe pilosis. Stylus luteus v. ± obscurus. Achaenia subatra.

Hucusque in Sudetis tantum inventum.

Variat: 1) normale G. Schneid., Hier. d. Westsudeten I. c. Heft 41 et 42 p. 21 (1891), indumento canescenti longo.

a) *verum*, foliis radicalibus interioribus oblongo- vel lineari-lanceolatis 15—20 mm latis obtusis saepissime mucronatis leviter sinuato- v. repando-dentatis. — In m. Riesengebirge a m. Rehhorn usque ad Neue schlesische Baude haud infrequens, (800—) 1000—1605 m; Glatzer Schneeberg (Fiek).

b) *latifolium* G. Schneid. l. c., foliis radicalibus interioribus spathulato-lanceolatis ad 3,5 cm latis 13—19 cm longis, in petiolum ad 6 mm latum angustatis ± obtusis plerumque sinuato-dentatis. — Riesengebirge: Melzerlehne, Weisse Wiese, Obere Teichränder, raro.

c) *angustifolium* G. Schneid., foliis radicalibus interioribus anguste v. lineari-lanceolatis 10—12 cm longis 1 cm latis obtusiusculis v. subacutis subintegerrimis. — In m. Asciburgensibus: Auparand, Weisse Wiese, Koppenplan, Kiesberg, Melzerlehne, Schneekoppe, Rehhorn.

2) *villosissimum* Sagorski apud Schneid. l. c. p. 22, indumento ± albo-sericeo denso longoque (ad 8 mm), foliis latioribus angustioribusve. — Cum praecedenti forma.

3) *calvenscens* G. Schneid. l. c., indumento in foliorum parte superiore cauleque abbreviato, 1—2 (—3) mm, (saepe multo) minus denso. — Weisse Wiese, Kleine Sturmhaube, Kleine Koppe.

4) *stylosum* (Wimm. Grab. p. p. min.) G. Schneid. l. c., ligulis apice destructis, stylisque ex tubo exsertis. — Riesengrund, Kl. Koppe, Kiesberg, Auparand, Weisse Wiese, Melzerlehne, Kl. Lomnitz supra Melzergrund.

Haec subspecies transitum inter ssp. *melanocephalum* et *H. Fritzei* F. Sch. formas macrocephalas sistit. Per culturam sponteque etiam ligulas ligulatas producit.

Tab. 129, Fig. B. 5—7. *H. alpinum* L. ssp. *tubulosum* Tsch. (e m. Rehborn pr. Schatzlar in montibus Asciburgensibus, leg. Pax). 5. Flos. 6. Squama. 7. Foliorum margo.

c) *Halleri* Zahn.

Subspecies **Halleri** Vill., Hist. pl. Dauph. III (1789) p. 104, tab. 26 (falso „*H. hybridum*“ inscripta); *H. alpinum* III *Halleri* Gaud., Fl. Helv. V p. 68; nec Tausch l. c. Caulis subtenuis v. gracilis v. plerumque crassiusculus v. crassus, flexuosus, \pm (saepe angulato-)striatus, pilis canescentibus basi atris ad 10 mm longis brevibus immixtis dense pilosus, glandulis \pm longis v. plerumque brevibus permixtis dense obsitus, superne dense densissimeve, deorsum cito deminute floccosus, saepe caules laterales evoluti, omnes monocephali, v. interdum caulis \pm profunde furcatus, rami primarii 1—3 valde remoti crassiusculi oblique erecti monocephali, acladium $\frac{1}{5}$ — $\frac{1}{1}$ totius caulis exhibens. Folia rosularia numerosa saepe sat magna, sordide viridia subglaucescentia v. canescenti-viridia, siccitate sordide lutescenti-viridia, \pm lanceolata, saepe \pm spathulata, obtusa v. acuta, plerumque in petiolum late alatum longe sensimque attenuata, dentata v. irregulariter grosseque sinuato-dentata v. dentibus prominentibus munita, saepissime pluridentata et in margine \pm undulata, medio-criter sat denseve longipila, sat dense sublongeque glandulosa; caulina 1—3 plerumque bene evoluta, inferiora saepe radicalibus similia sat magna. Involucrum magnum saepe plus 15 mm longum crasse ovatum v. -globosum, denique late ventricosum-depressum, longe villosopilosum, sat dense glandulosum, effloccosum. Squamae latae v. latiusculae, obtusa v. acutae, subatrae, exteriores saepe \pm foliaceae obscure virides squarrosae in bracteas transientes (interdum involucrum externum magnum formantes). Flores \pm dense pilosi, plerumque tubulosi, haud raro lingulati, rarissime stylosi, stylis obscuris longe prominentibus. Achaenia subatra.

In Alpibus Europae centralis inter (1500—) 2000—2600 (—2900) m tantum crescens.

Variat: $\alphagenuinum Zahn, floribus brunneo-luteis angustissime tubulosis facile excidentibus, apice fere clausis et edentatis v. dentibus inconspicuis munitis, stylis in tubo occultis, achaeniis sine fecundatione fertilibus.$

Variat: a) *verum*, floribus lingulatis.

b) *stylosum*, floribus abbreviatis stylis longe exsertis. — Rarissime.

Tab. 130. *H. alpinum* L. ssp. *calenduliflorum* Backh. (e m. Koppenplan, leg. Lorenz). 1. Dentes ligularum. 2. Apex squamarum. 3. Pedunculus sub involucrio. 4. Nervus dorsalis foliorum. 5. Foliorum margo.

d) *Pseudofritzei* Zahn.

Subspecies **pseudofritzei** Benz et Zahn, Oesterr. bot. Zeitschr. (1902) no. 7. Caulis 10—25 cm altus tenuis v. gracilis v. interdum subcrassiusculus parum flexuosus substriatus mediocriter v. sat dense pilosus, pilis canescentibus, apicem caulis versus basi nigris, 1—3 mm longis, superne disperse vel modice, inferne sparsim glandulosus, glandulis parvis, usque ad basin mediocriter, superne dense floccosus v. subcanotomentosus, phyllopodus v. interdum hypophyllopodus, plerumque monocephalus. Folia gramineo-viridia sat mollia v. subpapyracea remote glanduliformeque denticulata, rarissime subdentata, apice saepe \pm plicata, radicalia alato-petiolata, exteriora elliptico- v. lanceolato-spathulata obtusa mucronulata in petiolum

¹⁾ Involucra „*eglandulosa*“ dicit G. Schneider, in Sag. et Schn., Fl. Centr.-Karp. II (1891) p. 326.

sensim angustata, interiora \pm lanceolata saepe subspathulata acutiora, omnia utrimque disperse mediocriterve pilosa, pilis submollibus 0,5—2,5 mm longis, in margine densius pilosa, 1—3 mm, vel ubique \pm glabrescentia, subtus v. etiam in parte superiore disperse mediocriterve floccosa, in margine semper subfloccosa et disperse minuteque glandulosa, petioli et nervi dorsales interdum \pm purpurascens; folia caulina 2—5 subcito decrescentia lanceolata \pm acuta mucronata, inferiora lanceolata late alato-subpetiolata v. basi subangustata sessilia, interdum basi aequilata v. subrotundata, superiora \pm bracteiformia, omnia sed praecipue superiora utrimque v. praesertim subtus subfloccosa, in margine densius floccosa, denticulata v. subintegerrima. Involucrum globoso-ovatum denique \pm late depressum, 10—15 mm longum, squamae subangustae lineari-lanceolatae acutae apice subbarbulatae, exteriores acutiusculae, obscurae v. nigro-virides, effloccosae, sat dense minuteque glandulosae, pilis canescentibus 1—2,5 mm longis sat dense pilosae subvillosae, pedunculi apice plerumque leviter incrassati, bracteis lineari-lanceolatis linearibusve subfoliaceis obsiti. Ligulae dilute luteae apice breviter subpilosae vel fere glabrae, stylus luteus denique subobscurus, achaenia brunneo-atra.

Stiria, Alpes Carpatho-Transsilvanicae.

Variat: α) **genuinum** Z., caulibus apice subcanotomentosis disperse, rarius mediocriter glandulosis, glandulis *minutis* obsitis.

1) normale, caule gracili v. interdum subcrassiusculo elatiore, foliis elongatis maioribus, capitulis 12—15 mm longis, indumento modice denso.

a) *verum*, caule monocephalo, floribus lingulatis. — Stiria: Huehnerkar et Zeyritzkampel pr. Wald (Khek, de Benz); Dullwitz superior in m. Hochschwab (de Benz).

b) *furcatum*, caule furcato 2-cephalo. — Dullwitz superior (Nevole).

c) *tubulosum*, floribus \pm tubulosis: Huehnerkar (Khek).

2) pergracile, caule tenui v. gracili humili basi saepe purpurascens, foliis sat parvis in nervo dorsali pariter ac in petiolo purpurascens, capitulis 10—12 mm longis.

a) *subpilosum*, foliis caulibusque ubique subpilosis. — Zeyritzkampel, Huehnerkar, Schoberspitze pr. Turrach (Khek, Fest). Babiagora (de Degen).

b) *glabellum*, foliis subpilosis v. in margine tantum breviter subpilosis, caulibus mediocriter sparsimve brevipilis. — Zeyritzkampel, Huehnerkar, Dullwitz superior ad m. Hochschwab (Khek, de Benz).

β) **melanocephaloides** Zahn, caule superne mediocriter v. saepe sat dense glanduloso, glandulis *sublongis*.

1) normale Z., caule elatiore, foliis elongatis, capitulis ad 15 mm longis v. paulo brevioribus. — Huehnerkar pr. Wald (Khek). — Inter ssp. *melanocephalum* Tausch et *pseudofritzei* quasi intermedium.

2) *gracilescens* Z., caule tenui, foliis sat parvis, capitulis 10—12 mm tantum longis. — Transsilvania: In m. Vurfu Pelaga (Retyezát), leg. de Degen; Babiagora (id.). — Inter ssp. *pseudofritzei* 2) *pergracile* et ssp. *alpinum* quasi intermedium.

Exsicc. C. H. Zahn, Hieraciotheca Europaea no. 274.

Tab. 131, Fig. A. 1, 2. *H. alpinum* L. ssp. *pseudofritzei* Benz et Zahn $\alphagenuinum 1) *normale* $\alphaverum Z. (Zeyritzkampel, leg. R. de Benz). 1. Dentes ligularum. 2. Foliorum margo.$$

Exstat etiam ssp. *hallerioides* Zahn, habitu omnino *H. Halleri* Vill., caule interdum furcato, capitulis sat magnis, ligulis lingulatis apice plerumque parum pilosis, stylis denique subobscuris, foliis gramineo-viridibus \pm elongato-lanceolatis, in margine semper subfloccosis pluridentatis (dentibus saepe grossioribus), radicalibus exterioribus elongato-lanceolato-spathulatis \pm obtusis.

Stiria: Huehnerkar pr. Wald, inter ssp. *pseudofritzei* et ssp. *Halleri* (leg. E. Khek).

Species intermediae:

83. Hieracium Rostani N. P. = *alpinum-villosum* N. P., Monogr. Hierac. Mitteleurop. II (1886—1889) p. 229.

Subspecies *korongyisense* Zahn, Mag. bot. lap. (1906) p. 71. Caulis c. 25 cm altus subcrassiusculus parum flexuosus substriatus dense pilosus, 3—5 mm, usque infra medium subfloccosus subglandulosus. Folia viridia subglaucescentia subrigidiuscula utrimque sat dense pilosa, 2—4 (—5) mm, denticulata v. subdentata, effloccosa, in margine nervoque dorsali glandulis minutis sparsis obtecta, radicalia c. 5, lanceolata utrimque, basin versus longe sensimque attenuata, acuta, late alato-subpetiolata, in margine saepe subundulata; caulina 3—4 sensim decrescentia, inferiora 1—2 radicalibus similia, superiora ovato-lanceolata basi subattenuata sessila v. basi rotundata. Inflorescentia furcata 2 (—3) cephalis, acladium 5—9 cm longum, rami primarii 1 (—2) monocephali, capitula (1—) 2 (—3). Involucrum c. 15 mm longum globoso-ovatum denique depressum, squamae e basi latiuscula sensim angustatae acutissimae, effloccosae, disperse tenuiterque glandulosae, pilis basi nigris apice subobscuris 2—3 mm longis subvillosae. Pedunculi obscure canotomentosi, pilis subobscuris basi aterrimis 3—4 mm longis densis et glandulis nonnullis brevibus obtekti 2—3 bracteati, bracteis inferioribus saepe foliaceis. Ligulae tubulosae apice subglabrae, stylus luteus, achaenia brunneo-atra.

Habit. in m. Korongyis *Carpathum* Rodnensium et in m. Ciaréanu comit. Mármaros *Hungariae*, leg. Ade. — Flor. fine Iul.

Habitu omnino *H. villosa* simile, sed indumento in involucris pedunculisque obscuriore basi nigro, involucris caulomatibusque pariter ac foliorum margo glandulis parvis haud numerosis obsitis.

Caulis 10—20 cm altus scapiformis monocephalus aphyllus v. 1—3 foliis caulinis parvis lineari-lanceolatis v. linearibus obsitis, pariter ac folia sat dense pilosus, 4—8 mm, et minute glandulosus, superne fere canotomentosus. Folia rosularia \pm numerosa plerumque petiolata elongata saepe longa, exteriora \pm spathulata obtusa, interiora lanceolata v.

anguste lanceolata, obtusiuscula v. plerumque acuta saepe \pm plicata, in margine \pm distincte remoteque denticulata v. saepe subundulata integerrima, mollia, \pm lutescenti-viridia, in margine subglandulosa rarius fere eglandulosa. Involucrum 10—13 (—16) mm longum crasse ovatum basi rotundatum denique globosum. Squamae e basi lata longe acuminate acutissime nigrovirides, exteriores sublaxae, omnes densissime pilosae sub indumento fere occultae, pilis obscuris v. dilutis v. albis sericeis 3—4 mm longis, \pm eglandulosae et (pariter ac folia) effloccosae. Flores dilute lutei plerumque lingulati extus longe pilosi, dentibus subpilosis v. sparsim ciliatis, stylis dilutis v. obscuris, achaeniis brunneo-atris, 3,5 mm longis.

In *Alpibus* elatioribus, 17—2600 m. — Flor. Iul.—Aug.

Subspecies **cochleariifolium** Zahn; *H. mentitum* A.-T. et Chenev. in sched. Caulis ubique pilosus; folia petiolata, in margine subglandulosa, caulina parva; stylus plerumque luteus, interdum subobscurus. — Helvetia: St. Bernhard: Les Combes (Touton), in v. Bagne (Zahn), in alpe Esserze (Wolf), in v. Eginen (Favrat), in iugo Furka (Zahn); Kirchstuhl in m. Hasliberg pr. Meiningen (Bernoulli); Zervreila (Bruegger); Engadina: in iugo Muretto (Muret), St. Moritz, Piz Alv, Piz Frizlas pr. Berguen (Peter), pr. hospitium Bernina, Val Roseg (Naegeli), V. Muraigl, V. Bevers, Piz Padella (Peter), Albula (Favrat); V. Piora: ad lacum Ritom (Bernoulli); Camoghé (Jaeggi), V. Bosco: inter Madone et iugum Quadrella (Aubert); Tirolia: in v. Vennatal iuxta iugum Brenner et in iugo Pfitscher Joch, Schoenberg pr. Luttach, Dona (ubi?), Fusch (apud N. P. II p. 258).

Ex mea sententia cl. Naegeli et Peter sub nomine „*cochleare*“ duas formas diversas commiscuerunt: 1) *H. alpinum*—*glanduliferum*, 2) *H. cochleare* Huter, subspeciem *H. nigrescentis* Willd., quae in tabulis proximis delineabitur.

Tab. 132, Fig. A. 1—3. *H. cochleariifolium* Zahn ssp. *cochleariifolium* Z. (e m. Hasliberg, leg. Bernoulli). 1. Dentes ligularum. 2. Squama. 3. Foliorum margo.

Subspecies **pseudalpinum** N. P. Monogr. Hierac. Mitteleurop. II (1886—1889) p. 259. Involucra et folia eglandulosa v. glandulis subnullis (praecipue in foliorum nervo dorsali) praedita, caulis ad 18 cm altus, inferne \pm pilosus, superne dense glandulosus et interdum fere epilosus; folia caulina 2—3 subsensim decrescentia, rosularia oblongo-lanceolata v. lanceolata saepe sat magna, basin versus in petiolum late alatum sensim angustata. Flores haud raro subtubulosi, ligulae apice ciliatae, stylus obscurus.

Helvetia: In iugo Simplon, 2000 m, prope hospitium (Wolf); in iugo Gotthard (Muret) et in iugo Spluegen (Zahn).

Tab. 132, Fig. C. 7, 8. *H. cochleariifolium* Zahn ssp. *pseudalpinum* N. P. (e iugo Spluegen legi). 7. Nervus dorsalis et margo ex parte inferiore foliorum caulinorum. 8. Squama.

Subspecies **pseudoglanduliferum** Zahn, in Hierac. d. Schw. (1906) p. 380. Caulis 10—25 cm altus crassiusculus, superne dense longeque glandulosus canofloccosus et disperse mediocriterve pilosus, pilis ad 3,5 mm longis, inferne modice pilosus sensim minus glandulosus disperse floccosus. Folia rosularia sat magna, valde elongata (ad 15 cm) lanceolata longissime in basin late alatum angustata fere petiolata, utrimque sat dense pilosa, 2—5 mm, in margine leviter denticulata et glandulis nonnullis minutis adspersa; caulinum 1 parvum disperse glandulosum. Involucrum 12 mm longum latissimum, squamae disperse

minuteque glandulosae, pilis densissimis sericeis subfuliginosis villosae. Flores valde breves tubulosi, stylis luteis longissime exsertis.

Helvetia: „Aux Combes“ ad meridiem m. Gr. St. Bernhard (Touton); Tirolia borealis: in m. Bernhardseck pr. Elbigenalp in v. Lechtal (Gross).

Habitu *H. glanduliferi* robusti, sed involucris foliisque glandulosis *H. alpinum* in mentem revocans.

Tab. 132, Fig. B. 4—6. *H. cochleariifolium* Zahn ssp. *pseudoglanduliferum* Zahn (Gr. St. Bernhard, leg. Touton). 4. Flos. 5. Foliorum margo. 6. Squama.

85. Hieracium prasinicolor Besse et Zahn, Hierac. d. Schweiz (1906) p. 381; *H. Boccanei* f. *reducta* A. T. in sched. = **alpinum** < **Schmidtii** Zahn l. c.

Caulis ad 30 cm altus subtenuis usque ad basin subpilosus, 2,5—3,5 mm, usque ad basin disperse minuteque glandulosus, apicem versus magis magisque floccosus. Folia rosularia subnumerosa glauca subprasino-viridia subtus pallidiora, pedunculata, exteriora saepissime obovata obtusa, reliqua oblonga v. oblongo-lanceolata acuminata ± acuta, basin versus cito sensimve in petiolum alatum basi late vaginantem angustata, dentata, utrinque dentibus 4—5 maioribus, minoribus alternantibus in petiolos descendentibus, hic subulatis, supra glabra, in margine pilis rigidis 1—2,5 mm, in petiolo ad 3 mm longis obsita; folia caulina 1—2, imum lanceolatum grosse dentatum, summum lineare; omnia folia in margine et in nervo dorsali subfloccoso disperse minuteque glandulosa. Acladium 20—30 mm longum, rami primarii 1—3 remoti monocephali v. simpliciter (rarius dupliciter) ramosi, capitula (1—) 2—5 (—8). Involucrum 10—11 mm longum ovatum, squamae angustae acutiusculae v. acutae (extiores angustissimae), mediocriter breviterque pilosae, modice glandulosae floccosaeque, obscurae. Pedunculi canotomentosi sparsim pilosi sat dense glandulosi. Flores dilute lutei, ligulae apice breviter ciliatae, stylus denique ± dilutis, achaenia subatra.

Helvetia: In iugo Simplon c. 2300 m, inter frutices (Besse). — Iul.—Aug.

Verosimiliter inter *H. alpini* ssp. *Halleri* et *H. Schmidtii* ssp. *H. rupicolum* Fr. intermedium, sed posteriori propius accedens.

Caulis 10—30 cm altus, saepe ascendens et ± flexuosus, tenuis v. subgracilis rarius crassiusculus, ± striatus, phyllopodus. Folia rosularia numerosa, obovata, oblonga, oblongo-lanceolata v. lanceolato-spathulata, sensim in petiolum ± longum plerumque ± alatum angustata v. praecipue exteriora cito contracta v. basi ± truncata, apice obtusa v. breviter,

rarius longius acuminata, haud raro mucronata et \pm plicata, remote denticulata v. praecipue basin versus \pm grosse dentata v. sinuato-dentata, rarius subintegerrima, v. pluridentata, dentibus apice glanduliformibus interdum in petiolum descendentibus, \pm sordide, rarius dilute viridia, sat mollia v. rigidiuscula; caulina plerumque 0—3 cito decrescentia, inferius radicalibus interioribus simile, + petiolatum, saepe grosse dentatum, v. omnia \pm lanceolata v. summum lineari-lanceolatum v. longe subulatum. Inflorescentia monocephala v. \pm furcata suprafastigiata indeterminata oligocephala. Acladium breve v. ad 5 cm longum v. ad $\frac{1}{1}$ totius caulis exhibens, interdum nonnulli caules laterales evoluti; rami primarii nulli vel 1—2 (—4) evoluti \pm arcuato-ascendentes fere semper monocephali. Involucrum 10—15 mm longum, rarius longius, globoso-ovatum basi rotundatum denique (interdum late) depressum saepeque ventricosum; squamae conformes, exteriores saepe sublaxae, rarissime subfoliaceae, omnes fere regulariter imbricatae, latiusculae v. angustae, obtusiusculae v. acutiusculae v. acutae, interdum acutissimae, apice saepe \pm barbulatae, obscurae v. atrae v. atrovirides, saepe dilutius submarginatae. Bractee 1—3 parvae, rarius inferiores subfoliaceae. Pili in involucrio numerosi v. sat densi, \pm canescentes v. obscuri, basi atri, 1,5—3 mm longi, caulomata disperse v. \pm dense pilosa, 1,5—3 (—4) mm, folia in margine nervoque dorsali pariter ac in petiolo dense mediocriterve pilosa, 2—5 mm, rarius \pm calvescentia, utrimque \pm disperse mediocriterve, rarius densius pilosa, pilis mollibus v. subrigidiusculis interdum brevibus. Glandulae in involucrio pedunculisque modice numerosae v. sat densae, saepe breves, caulis basin versus deminutae, sed plerumque usque ad basin descendentes, in foliorum margine (etiam in nervo dorsali petioloque) subnumerosae v. dispersae saepe sat parvae, sed semper sub lente bene observandae. Flocci in involucrio nulli v. dispersi, rarissime subnumerosi. pedunculi obscure cani v. subcanotomentosi, caulis plerumque usque ad basin deminute floccosus, haud raro subincanus, folia effloccosa v. saepe in nervo dorsali subfloccosa, v. interdum praecipue caulina etiam in tota parte aversa disperse rarius modice floccosa. Flores saepissime dilute lutei. extus plerumque parum pilosi, ligulae apice \pm ciliatae v. interdum breviter subpilosae, stylus obscurus v. niger, achaenia atra.

Hab. in area geographica *H. alpini*, sed fugit summa loca huius speciei. — Flor. Iul., Aug.

Dispositio gregum:

- a) *Decipiens* Zahn, in Koch Syn. (1901) p. 1843; Hierac. d. Schweiz (1906) p. 382. *H. alpino* proximum. Folia lanceolata v. lanceolato-spathulata longe sensimque in petiolum \pm alatum angustata, rarius latiora et \pm cito in petiolum contracta. Caulis monocephalus vel furcato —2 (—3) cephalus, acladium ($\frac{1}{5}$ —) $\frac{1}{4}$ — $\frac{1}{2}$ (— $\frac{1}{1}$) totius caulis exhibens. Capitula saepe maiora. — Ssp. subpumilum, pseudohalleri, leontodontoides, decipiens, dubiosum, pseudodecipiens, cochleare, reichartense, subzinkenense, Sagorskii, pseudorhaeticum, rhaeticiforme, nigrescentiforme, valpiorae, sphaerocalathium, nivimontis, subeximium, bructerum, subrhaeticum.
- b) *Nigrescens* Zahn l. c. *H. silvatico* magis affine, ergo inter gregem *Decipiens* et *H. atratum* Fr. intermedium. Folia \pm cito v. subito in petiolum contracta plerumque latiora, late lanceolata v. oblonga, rarius angustiora sensimque angustata. Caulis oligocephalus (1—4) altifurcatus, acladio brevissimo v. ad 5 cm (— $\frac{1}{4}$ totius caulis) longo. Capitula plerumque minora. — Ssp. rhaeticum, stellulatum, subneglectum, nigrescens, stircolum.

a) *Decipiens* Zahn.

1. Caulis fere semper monocephalus.

Subspecies **subpumilum** Zahn, in Schinz et Kell., Fl. d. Schweiz ed. 2 II (1905) p. 313; Hierac. d. Schweiz (1906) p. 382; ssp. *pseudohalleri* a) *subpumilum* Zahn, in Koch

Syn. (1901) p. 1844; *H. himantophyllum* A.-T., Spicileg. Hierac. suppl. (1886) p. 45 p. p.; *H. lorophyllum* A.-T. prius, in Notes pl. Alp. p. 17 p. p. (apud determinationes A.-Touvetii in herbariis Helv.) Habitus ut in *H. alpini* L. ssp. *alpino*. Caulis 8—15 (—18) cm altus plerumque tenuis et monocephalus, rarissime profunde furcatus 2—cephalus, sat dense v. dense canopilosus disperse minuteque glandulosus densissime floccosus subcanotomentosus, interdum 1—2 caulibus lateralibus praeditus. Folia rosularia saepe sat parva, obovata v. oblonga v. oblongo-lanceolata, obtusa v. acutiuscula, denticulata v. \pm dentata, cito sensimve in petiolum brevem attenuata, mediocriter pilosa; caulina 0—2 parva subtus subfloccosa plerumque bracteiformia v. inferius lanceolatum. Involucrum 10—14 mm longum globosum v. globoso-ovatum, squamae subangustae acutiusculae v. acutae v. intimae acutissimae. Flores evoluti, interdum semitubulosi, dentes ligularum longi angusti dense ciliati, v. flores tubulosi ligulis apice \pm debilibus; rarissime floribus stylosis.

Exsiccata: Magnier, Fl. select. 2512.

Tab. 136, Fig. A. 1—3. *H. nigrescens* Willd. ssp. *decipiens* Tsch. 1) *normale* G. Schneid. (Weisse Wiese Sudetorum, leg. Sagorski). 1. Squama. 2. Pedunculus sub involucri. 3. Foliorum margo.

Subspecies **dubiosum** G. Schneider, in „Das Riesengebirge in Wort und Bild“, Heft 43 et 44 p. 24 (1892). Caulis erectus 18—25 cm altus \pm crassiusculus, pilis dilutis basi atris 1,5—2,5 mm longis, glandulis dispersis sub involucri numerosis floccisque superne densis basin versus deminutis vestitus, monocephalus. Folia mollia gramineo- v. sordide viridia, pariter ac petioli dense pilosa; radicalia florendi tempore numerosa, oblonga, elliptica v. ovata, rarius oblongo-lanceolata, in petiolum alatum mediocriter longum valde sensim angustata, apice rotundata v. obtusiuscula, subdenticulata v. leviter dentata; caulina 2—5, inferius v. etiam secundum spathulato-lanceolatum, in superiore quarta parte latissimum, deorsum in petiolum late alatum cuneato-angustatum acutiusculum, in superiore tertia parte utrimque subdentatum, media oblongo-lanceolata sessilia v. breviter attenuata, repando-dentata acutiuscula, summa parva sessilia lanceolata v. lineari-lanceolata acutiuscula v. acuta. Involucrium 15 mm longum semiglobosum, pilis 2—3 mm longis subvillosum, glandulis sublongis subglandulosum, parcefloccosum. Squamae numerosae subatrae, exteriores latae obtusae, mediae latiusculae obtusiusculae, intimae acutae. Ligulae partim involutae, subpilosae apice dense pilosae. Flores aureolutei. Stylus obscurus.

Transitum *decipiens*—*tubulosum* sistit.

In montibus Asciburgensibus 1250—1350 m: In declivitatibus meridionalibus supra lacum Kl. Teich, in m. Kiesberg et Seiffenberg (G. Schneider).

Subspecies **pseudodecipiens** G. Schneider l. c. Heft 43 et 44 (1902) p. 24. Caulis 25—28 cm altus erectus subflexuosus mediocriter pilosus, 2 mm, superne dense, deorsum deminute glandulosus, superne canofloccosus, usque ad basin mediocriter floccosus, monocephalus. Folia viridia utrimque mediocriter, in margine petioloque dense pilosa, pilis 0,5—1 mm, in petiolo ad 3 mm longis; radicalia 4—6, exteriora oblonga v. elliptica subdenticulata apice rotundata, interiora oblongo-lanceolata irregulariter sinuato-dentata, dentibus nonnullis maioribus antrorsum versis v. patentibus munita, acutiuscula v. acuta interdum apice plicata, omnia sensim in petiolum longum attenuata; caulina 3—5, inferius radicalibus interioribus simile, proximum lanceolatum breviter alato-petiolatum v. basin versus sensim angustatum, denticulatum v. dentatum, acutum, summa multo minora lineari-lanceolata basin versus angustata acutissima. Involucrium 16—17 mm longum semiglobosum denique basi truncatum dense pilosum, 2—3 mm, mediocriter sparsimve glandulosum, parcefloccosum. Squamae atrovirides, latiusculae, exteriores obtusiusculae, interiores acutiusculae v. acutae. Flores aureolutei, mediocriter, apice sat dense pilosi, stylus obscurus.

Inter ssp. *decipiens* et ssp. *calenduliflorum* intermedium, sed ssp. *decipienti* magis affine. Cum ssp. *calenduliflora* convenit foliis radicalibus interioribus irregulariter sinuato-dentatis, caule ad 5 foliato, capitulis magnis, ligulis magis pilosis, cum ssp. *decipiente* congruit foliorum radicalium exteriorum forma, foliis sensim in petiolos longos attenuatis, squamis acutioribus.

In montibus Asciburgensibus: In declivitatibus sub m. Kleine Koppe et supra lacum Kl. Teich, 1300—1350 m (G. Schneider).

Subspecies **cochleare** Huter, Exsicc. (1875); Zahn, in Koch Syn. (1901 p. 1884; nec A. Kerner, nec N. P., Hierac. Mitteleurop. II (1886—1889) p. 258; *H. Halleri* A. Kern. in sched. p. p.; *H. nigrescens* Huter, Exs. (1874). Folia rosularia numerosissima plerumque longe petiolata obovato-spathulata cochleariformia, acute denticulata, basi saepe 1—2 dentibus grossis munita, effloccosa; caulina 1—2 (—3) in nervo dorsali tantum parceffloccosa. Caulis 10—20 (—25) cm altus tenuis v. gracilis dense floccosus superne incanus, usque ad basin sparsim tenuiter glandulosus, superne minute subglandulosus, fere semper monocephalus, rarissime profunde furcatus 2-cephalus, sed interdum 1—2 caules laterales 1—3 cephalis evoluti. Tota planta sat dense v. dense pilosa subvillosa, pilis ubique 2—4 mm longis dilutis apice albidis, in involucri pedunculisque tantum basi obscuris. Involucrum semiglobosum obscure canum, 11—15 mm longum; squamae valde numerosae plerumque angustissimae longe acuminatae subacutae v. pleraeque acutissimae, exteriores interdum obtusiusculae, omnes mediocriter minuteque glandulosae sparsim floccosae. Flores lutei, ligulae apice subpilosae, stylus initio interdum subluteus, denique semper obscurus.

Eximia subspecies, totius plantae indumento ± denso dilutoque insignis.

1* Caulis plerumque bicephalus.

Subspecies **rhaeticiforme** Zahn (1903), in sched. herb. univers. German. Pragae. Rhizoma saepe pluricaule et rosulis nonnullis praeditum. Caulis 10—20 (—25) cm altus gracilis, inferne pilis ad 5 mm longis dilutis sat densis, superne obscuris mediocriter numerosis 3 mm longis obsitis, ubique subglandulosus sat denseque floccosus, superne (pedunculi) sat dense longeque glandulosus obscure canus. Folia radicalia numerosissima interdum ad 10 cm longa oblongo-lanceolata v. lanceolata breviter acuminata acutiuscula v. longius acuminata

acuta, in petiolum alatum sensim angustata, denticulata v. dentibus nonnullis grossioribus munita, gramineo- v. sublutescenti-viridia, interdum violaceo-subcolorata, sat dense longe- que pilosa, pilis albis subrigidiusculis 3—5 mm longis, sparsim glandulosa; caulina 2—3 linearia v. inferius lanceolatum, in parte aversa (radicalia interiora saepe in nervo dorsali tantum) subfloccosum. Acladium 1,5—5 cm ($-\frac{1}{2}$ totius caulis) longum, rami primarii (0—) 1—2, inferior interdum cauli fasciatus, capitula (1—) 2—3. Involucrum 11—13 mm longum semiglobosum, squamae angustae obscurae longe acuminatae acutae, sat dense cano- pilosae, 2—2,5 mm, breviter subglandulosae, effloccosae. Bractee 1—2 lineares. Flores saturate lutei, ligulae apice sat longe ciliatae, stylus niger.

Foliis sat dense longeque pilosis insigne, ssp. *reichartensi* et *subeximio* affine.

Stiria: In m. Stuhleck pr. Muerzzuschlag (G. Beck).

Subspecies **nigrescentiforme** Zahn, in Koch Syn. (1901) p. 1845; Hierac. d. Schweiz (1906) p. 384. Caulis gracilis v. crassiusculus (10—) 15—25 (—30) cm altus dense floccosus breviter pilosus, pilis 1—2,5 mm longis basi obscuris apice dilutis, tenuiter subglandulosus. Folia obscure sordideve viridia v. sublutescenti-viridia submolliora, radicalia numerosa supra sub- tusque sparsim mediocriterve, in margine petioloque subdense pilosa, 0,5—3 mm, tenuiter subglandulosa, effloccosa, exteriora minora interdum parva obovato-spathulata, rotundata v. obtusa saepe mucronata subcito in petiolum alatum attenuata denticulata v. irregulariter sub- dentata, interiora maiora oblongo- vel lanceolata spathulata obtusa v. acutiuscula plerumque apice \pm plicata irregulariter dentata v. grosse dentata, dentibus \pm triangularibus, basin versus longius sensimque in petiolum brevem v. sublongum angustata; caulina 1—2, inferius lanceolatum, summum anguste lanceolatum v. lineare in 1—3 bracteis lineares saepe subfoliaceas transiens. Caulis monocephalus v. haud raro furcato- 2 (—3) cephalus, interdum 1—2 caules laterales 1—2 cephalis evoluti, acladio brevissimo v. plerumque $\frac{1}{3}$ — $\frac{1}{2}$ ($-\frac{1}{4}$) totius caulis longo. Involucrum 10—15 (—16) mm longum ventricosum-globosum denique saepe latissime depressum \pm obscurum; squamae angustae, rarius latiusculae, acutiusculae v. acutissimae, pilis apice canescentibus 1,5—2,5 mm longis sat dense pilosae, minute subglandulosae effloc- cosae. Flores fere semper breviter tubulosi apice discissi, stylis atris longissime exsertis.

Helvetia: In m. Feuerstein v. Entlebuch (Bruegger), Klimeswand in m. Pilatus (Herb. Kaeser), Weissstannental: in alpe Scheibbs et inter alpes Martella et Tamona (Wilczek), in montibus Kurfirsten: in alpe Hinterriese (Schlatteker), Niederenalpe—Schlavigalpe (Bruegger), Brueggerhorn pr. Arosa (Bahnmeier), Staetzer-alpe (Bruegger), in alpibus Sarganser- et Seg- nesalpe (Moritzi, Muret), Graue Hoerner (Correns), Val Avers (Kaeser), in iugo Spluegen 1950—2000 m (Zahn), St. Maria in v. Medels (Muret), Piz Mundaun 2050 m, Guener Alpe, Heidebuehl ad m. Piz Beverin supra Glas 2100 m (Steiger).

Tab. 138, Fig. B. 3—5. *H. nigrescens* Willd. ssp. *nigrescentiforme* Zahn (e iugo Spluegen legi). 3. Squama. 4. Pedunculus sub involucro. 5. Foliorum margo.

Subspecies **valpiorae** Zahn, in Schinz et Kell., Fl. d. Schw. ed. 2 II (1905) p. 314; Hierac. d. Schweiz (1906) p. 384. Planta robusta 20—30 cm alta ubique mediocriter sat denseve pilosa, 2—3 (—4) mm, caule gracili v. crassiusculo dense floccoso, sub involucro mediocriter sat longeque glanduloso monocephalo v. profunde furcato- 2-cephalo, interdum 1—3 caulibus lateralibus 1—3 cephalis circumdato. Folia radicalia numerosa magna longe petiolata, pleraque irregulariter et saepe valde grosse dentata, dentibus late triangularibus munita; caulina 1—2 lanceolata v. summum lineare. Involucrum magnum 15—18 mm

longum semiglobosum basi denique subtruncatum, canescens, squamis sublatiusculis e basi latiuscula longe acuminatis, acutis v. acutissimis, pilis canescentibus basi obscuris 1,5—2,5 mm longis subvillosis, sparsim minutissimeque glandulosis, exterioribus saepe subviridibus. Ligulae luteae, dentibus angustis sat dense pilosis saepe longis, interdum subtubulosae. Stylus niger.

Caule robusto, foliis involucrisque magnis, squamis exterioribus saepe subviridibus insigne.

Praecipue in Engadina superiore: Maloja (Bruegger), ad torrentem Ordlegna vallis Muretto 1900 m (Hegi), Sils (Touton), Val Bevers (Kraetli, Touton); Val Piora: ad meridiem lacus Ritom (Bernoulli), Camoghé (Muret); Col di Trona supra Introbio ad lacum Comersee 2000 m (Wilczek); Rhaetia: inter Parpan et Churer Joch (Touton), Sertigtal (Zahn).

Subspecies **sphaerocalathium** Handel-Mazzetti et Zahn. Caulis (10) ad 30 cm altus gracilis v. crassiusculus dense floccosus, superne subcanotomentosus, sparsim minuteque, superne paulo densius glandulosus, pilis mollibus canescentibusque 2—3 mm longis sat dense vestitus, 1—2— (rarissime 3—) cephalus. Folia radicalia sat magna mollia brevius longiusve petiolata, elliptico-, oblongo-lanceolata v. lanceolata, exteriora saepe obtusiuscula, in petiolum subcito contracta, v. acutiuscula, pleraque brevius longiusve acuminata acuta, basin versus sensim in petiolum alatum, v. fere usque ad petiolorum basin angustata, dentata, utrimque 2—3 dentibus mediocribus munita, ubique dense, basin versus densissime molliterque pilosa 2—4 (—5) mm, petiolis \pm villosis; caulina 1—2 (—3) lanceolata subdentata v. summum lineari-lanceolatum integerrimum, in nervo dorsali subfloccosum. Acladium ad $\frac{1}{2}$ totius caulis longum, pedunculi crassiusculi. Involucrum subobscurum magnum semiglobosum 15—17 mm longum denique late ventricosum; squamae latiusculae acuminatae acutiusculae v. acutae, sat dense pilosae, 1—2,5 mm, disperse minuteque glandulosae, basin versus parce-floccosae. Ligulae sat magnae, luteae apice disperse breviterque pilosae. Stylus niger.

Tirolia borealis: ad rupes inter Fotscherferner et iugum Hochgratl (de Handel-Mazzetti), Dohnalpe vallis Lesach 2300 m (Jabornegg).

Tab. 138, Fig. A. 1, 2. *H. nigrescens* Willd. ssp. *sphaerocalathium* Handel-Mazzetti et Zahn (inter Fotscherferner et Hochgratljoch, leg. Handel-M.). 1. Squama. 2. Foliorum margo.

Subspecies **nivimontis** Oborny et Zahn, apud Zahn Schedae ad Hieraciothecam Europ. Cent. III (1908) p. 22; *H. eximium* $\alphagenuinum β) *pseudonigrescens* G. Schneid., Oesterr. bot. Zeitschr. (1887) p. 275; *H. decipiens* β) *orientale* G. Schneid., Hierac. Westsudet. in „Das Riesengebirge in Wort und Bild“, Heft 41 et 42 (1891) p. 27. Rhizoma saepe pluricaule. Caulis (15—) 20—25 (—30) cm altus crassiusculus, pilis canescentibus basi obscuris 2—3,5 mm longis sat dense pilosus, dense floccosus, apice obscure-subcanotomentosus mediocriterque (pedunculi) glandulosus, deorsum glandulis minutis dispersis sparsive obsitus, flexuosus. Folia radicalia numerosa v. numerosissima submollia gramineo-v. sublutescenti-viridia sat magna elongata ad $\frac{1}{2}$ totius caulis longa, in petiolum haud ita longum late v. latissime alatum longe sensimque attenuata v. fere usque ad basin attenuata sessilia, exteriora saepe lanceolata subspathulata obtusiuscula saepe subintegerrima, pleraque late lanceolata v. lanceolata acutiuscula v. acuta saepe subplicata, denticulata v. acute dentata v. dentibus nonnullis longioribus grossisve munita, utrimque sat dense, in margo petioloque densius vel basi ipsa densissime pilosa, 2—4 mm, in margine floccis sparsis glandulisque minutis adspersa; caulina 1—2 parva, inferius lanceolatum saepe dentatum, superius$

lineari-lanceolatum v. bracteiforme, in nervo dorsali subfloccosum. Inflorescentia monocephala v. furcato- 2—3 (—5)-cephala, acladio $\frac{1}{4}$ — $\frac{1}{2}$ totius caulis longo, ramis primariis ad 3 evolutis monocephalis, rarissime inferiore 2 cephalo. Involucrum 14—16 mm longum late ventricosum denique latissime depressum subnigrum, squamae subnigrae sublatiusculae v. angustae, acuminatae obtusiusculae v. pleraeque acutae et apice intense barbulatae, effloccosae, sat dense molliterque pilosae 1,5—2 mm, mediocriter minuteque glandulosae, numerosae. Bracteae 2—3 lineares subfoliaceae. Ligulae numerosae luteae subangustae, dentibus angustis sat longis distincte pilosis. Stylus initio subluteus denique brunnescens.

Forma eximia, foliis elongatis, capitulis subatris magnis stylisque initio subluteis, caulibus pedunculisque crassiusculis insignis et formulae *calenduliflorum* < *silvaticum* optime respondens.

In cacumine m. Spieglitzer Schneeberg, 1420 m, ad limites Moraviae et Silesiae, Heilighübel in montibus Gesenke, 1400 m (Oborny).

Exsiccata: Zahn, Hieracioth. Europ. no. 275.

- β) **hnetiesae** Zahn. Caulis ad 30 cm altus modice sat dense pilosus, 2—3 mm, acladio ad 6 cm longo, ramis 4 valde remotis monocephalis, foliis 4, inferioribus lanceolatis sat longe acuminatis \pm sinuato-dentatis obsitis. Capitula 5,

terminale maius 12—15 mm longum denique latissime depressum, squamae subangustae acutiusculae v. acutae, intimae acutissimae, pilis dilutis basi atris dense pilosae, 2—3 mm, disperse glandulosae. Pedunculi cani modice subbreviterque glandulosi \pm pilosi, acladium c. 4 bracteis subfoliolaceis obsitum. Stylus initio luteus. — In m. Hnietiesa ad limites Galiciae et Hungariae (Włoszczak).

Tab. 141. Fig. A. 1—4. *H. nigrescens* Willd. ssp. *nigrescens* α) *genuinum* Zahn (Riesengrund, leg. Bänitz). 1. Dentes ligularum. 2. Squama. 3. Pedunculus sub involucri. 4. Foliorum margo.

Subspecies **stiricolum** Zahn. Caulis ad 30 cm altus gracilis v. crassiusculus, breviter albo-subpilosus, 1—2 (—2,5) mm, superne dense floccosus sparsim glandulosus, basin versus subeffloccosus subeglandulosus. Folia radicalia viridia, saepe subglaucescentia, subrigidiuscula utrimque modice sat dense pilosa, pilis in parte superiore rigidiusculis, subtus mollibus, in margine nervoque dorsali numerosioribus 1—3 longis, in margine disperse minuteque glandulosa, omnia late alato-petiolata magna, exteriora obovata rotundata minora basi subito contracta, reliqua ovato-, elliptico- v. oblongo-lanceolata obtusiuscula v. acutiuscula mucronata, basin versus cito subsensimve angustata in petiolum decurrentia, omnia irregulariter grossequ sinuato- v. inciso-dentata, dentibus in petiolum descendentibus triangularibus v. lanceolatis plerisque antrorsum versis; caulina plerumque 2, inferius oblongo-lanceolatum utrimque acuminatum sessile v. subpetiolatum, basin versus valde grosse v. inciso-dentatum, summum lanceolatum vix denticulatum subtus interdum parum floccosum. Inflorescentia laxissima paniculata v. altefurcata, acladium 2—5 cm longum, rami primarii (0—) 1—2 (—3) valde remoti, inferior ex axillo folii caulini inferioris ortus saepe abortus, mono- v. inferiores 2—3-cephali, capitula (1—) 2—5 (—7). Involucri semiglobosum (10—) 12—15 mm longum denique latissime depressum, obscurum, squamae latiusculae acuminatae obtusiusculae v. acutiusculae apice distincte barbulatae, interiores tantum acutae obscure viridi- vel dilute submarginatae, omnes pilis 1,5—2 mm longis basi atris apice subdilutis mediocriter numerosis v. sat densis, glandulis subelongatis sat copiosis et praecipue in margine basin versus floccis dispersis mediocriterve numerosis obsitae. Pedunculi obscure canotomentosi, sat dense pilosi, 1—2,5 mm, mediocriter sat dense glandulosi, pilis basi atris apice subdilutis et bracteis 1—2 linearibus saepe subfoliolaceis obscuris v. subviridibus obsiti. Flores saturate lutei, ligulis anguste sat longeque dentatis breviter subpilis, stylis luteo-brunneis denique obscuris.

Variat: α) **genuinum** Zahn. Ut supra. — Stiria superior: In alpe Passeggeralm versus Tweng, sol. calc., 1600 m, Hradofen pr. Predlitz, sol. schist., 1800 m, Predingerhütte in m. Preber, sol. schist., 1800 m (B. Fest).

β) **nigrescenticeps** Zahn, foliis saepe longius petiolatis gramineo-viridibus, plerisque oblongo-lanceolatis utrimque attenuatis brevius longius acuminatis acutiusculis vel acutis tantum denticulatis v. subdentatis v. interdum dentibus nonnullis maioribus obsitis; caulinis lanceolatis, inferiore elongato utrimque longissime angustato acuto. — Hradofen pr. Predlitz 1900 m, St. Margarethen pr. Neumarkt, 1300 m (B. Fest).

Tab. 143, Fig. A. 1—2. *H. nigrescens* Willd. ssp. *stiricolum* α) *genuinum* Zahn (Passeggeralm pr. Tweng, leg. B. Fest). 1. Squama. 2. Pedunculus sub involucri. [3 ad fig. B pertinet].

Subspecies **stellulatum** Zahn (*pseudocochleare* olim in sched. nonnull.). Caulis (10—) 15—25 (—30) cm altus gracilis, pilis dilutis basi obscuris 2—3,5 mm longis subrigidiusculis v. submollibus ± patentibus subnumerosis v. subdensis vestitus, usque ad basin dense v. densissime floccosus subglandulosus, superne albo- v. canotomentosus. Folia viridia saepe subrigidiuscula utrimque modice, superne rigidiuscule pilosa, in margine nervoque dorsali et praecipue basin versus densius pilosa saepe subvillosa, 1—2 (—3) mm, disperse minuteque glandulosa, *in margine* interdum subundulato *semper* ± *floccosa*; radicalia ± late alato-petiolata, elliptico- v. oblongo-lanceolata, basin versus longe sensim angustata, exteriora minora obtusiuscula submucronata, interiora acutiuscula interdum apice ± plicata, omnia glanduloso-denticulata v. subdentata, subtus subfloccosa; caulina 3—5 subcito decrescentia, inferiora subpetiolata lanceolata denticulata, reliqua angustiora acutiora basi angustata sessilia, summa linearia in bracteis decrescentia, *omnia subtus modice sat denseve, in parte superiore sparsim mediocriterve floccosa* saepe subcanescenti-viridia. Inflorescentia laxa paniculata v. ± furcata, acladium (5 mm —) 2—5 (—8) cm longum, rami primarii (0—) 1—3 (—5) ex axillo omnium foliorum caulinarum orti oblique erecti, inferiores longi subfoliati v. bracteis linearibus foliolaceis obsiti 1 (—3) cephalis, capitulis inferioribus plerumque abortis; interdum caules laterales evoluti. Capitula (1—) 2—6 (—10). Involucrum 11—14 mm longum semiglobosum denique late ventricosum subobscure, pilis 1—2 mm longis canescentibus sat dense pilosum; squamae subatrae e basi latiuscula acuminatae ± obtusae v. acutiusculae v. intimae tantum acutae, apice subbarbulatae, glandulis dispersis v. interdum modice numerosis brevissimis obsitae, fere effloccosae. Pedunculi albo- v. canotomentosi, pilis apice albidis basi atris mediocriter numerosis v. sat densis 2—3 mm longis glandulisque dispersis obsiti. Flores submagnum lutei v. aureo-lutei, ligulis apice breviter ciliatis, stylis obscuris, acheniis atris.

Subspecies *eximia*, foliis caulinis ubique subfloccosis insignis et verosimiliter inter *H. alpini* ssp. *pseudofritzei* et *H. silvaticum* intermedia, sed *H. pseudofritzei* magis affinis.

Variat: 1) *pseudocochleare* Zahn, phyllopodum minus 20 cm altum, foliis caulinis 2—4 (—5) subcito decrescentibus munitum. — Tirolia: in pratis Pfranzwiesen pr. Oberlesach haud procul a Kals (Pichler); Carinthia: in iugo Plöcken (Pichler et in iugo Mallnitzer Tauern (de Benz).

2) stygiiforme Zahn, hypophyllopodum, 25—30 cm altum, foliis caulinis 6—8 sensim decrescentibus, summis ± bracteiformibus. — In summis alpibus iuxta iugum Plöcken (Pichler).

Tab. 143, Fig. B. 3—5. *H. nigrescens* Willd. ssp. *stellulatum* Zahn 1) *pseudocochleare* Zahn (e pratis Pfranzwiesen pr Oberlesach, leg. Pichler). 3. Foliorum margo. 4. Squama. 5. Pedunculus sub involucrio.

87. Hieracium atratum Fries = **alpinum** < **silvaticum** Zahn. — Fries, Symb. (1848) p. 105; Epicr. (1862) p. 95; Hartmann, Fl. Scand. ed. 8 p. 24; Rehmann, Oesterr. bot. Zeitschr. (1873) p. 213; Neilreich, Krit. Zus. Hierac. (1871) p. 44; Fiek, Fl. Schles. (1881) p. 275; Zahn, Hierac. d. Schweiz (1906) p. 387; *H. alpinum* 2) *nigrescens* Koch, Syn. ed. 2 p. 526 p. p.; *H. nigrescens* Wimm., Fl. Schles. ed. 3 (1857) p. 310; *H. alpino* — *vulgatum* F. Schultz, Archives (1855) p. 19.

Caulis (10—) 15—30 (—60) cm altus plerumque strictus, tenuis v. gracilis, ± striatus v. angulato-striatus, inferne interdum rubescens, usque ad basin v. altius ± floccosus glandu-

losusque, basin versus subpilosus. Folia rosularia 3—6 obscure gramineo- v. sublutescenti-viridia, saepe mollia, subtus pallidiora, utrimque mediocriter v. sat dense v. subtus densius pilosa, rarius \pm glabrescentia, in margine \pm dense ciliata, 1—3 mm, et disperse sparsimve, rarius modice glandulosa, in nervo dorsali, rarius folia caulina in tota parte aversa subfloccosa, exteriora brevius petiolata, plerumque ovata, abrupte in petiolum contracta, obtusa, interiora longius petiolata, oblongo v. lanceolata, in petiolum sensim angustata, obtusa v. acuta, omnia praecipue basin versus leviter v. profunde sinuato-dentata v. -serrata, interdum nonnullis dentibus magnis praedita, rarius tantum denticulata; folia caulina 1—2 (—4, rarissime compluria) plerumque cito decrescentia, inferius petiolatum radicalibus simile, sequentia lanceolata basi cuneata sessilia v. subpetiolata, dentata, summum lineari-lanceolatum v. lineare. Inflorescentia alte furcata v. laxe paniculata, acladium 8—50 mm longum, rami primarii 1—4 (—5) remoti erecti saepe stricti, simpliciter, rarius dupliciter ramosi, capitula 2—7 (—20). Involucrum 10—13 (—15) mm longum oblongo-ovatum, squamae sublatiusculae v. angustae acuminatae obtusiusculae v. (interiores) acutiusculae v. acutae apice \pm barbulate, nigrae v. obscurae (interiores \pm dilute v. subviridi-marginatae), mediocriter v. sat dense pilosae glandulosaeque, pilis 1—1,5 mm longis canescentibus nigris intermixtis, v. \pm epilosae densissime glandulosae, subeffloccosae v. modice floccosae. Pedunculi superne tomentosi, mediocriter v. (superne) dense nigro-glandulosi, epilosi v. disperse v. mediocriter pilosi, pilis obscuris v. nigris, 1 mm longis. Flores plerumque aureolutei, ligulae subpilosae, apice mediocriter sparsimve ciliatae, stylus obscurus, achenia fere atra.

In ditione *H. alpini* sed saepe magis descendens. Scandinavia, Rossia borealis Scotia, in Sudetis, in Alpibus Carpatho-Transsilvanicis, in Alpibus Austriae, Bavariae, Italiae borealis et Helvetiae. — Flor. Iul., Aug.

Dispositio gregum:

- 1) Folia \pm sensim in petiolum angustata distincte glandulosa.
- a) *Atratum* Zahn, in Koch Syn. (1901) p. 1847. Involucra et pedunculi pilis glandulisque varie mixtis obsita; folia sordide v. sublutescenti-viridia.
- b) *Polycephalum* Zahn, in Koch Syn. p. 1848. Involucra et pedunculi dense glandulosa sparsim pilosa; folia caulesque dilute gramineo-viridia.
- c) *Schroeterianum* Zahn, Hierac. d. Schweiz (1906) p. 388. Involucra et pedunculi epilosa, glandulis numerosissimis saepe longis munita. — *Transitus atratum* \rightarrow *Bocconeii*.
- 1* Folia ovata v. lanceolata basi truncata, rotundata v. cito angustata, fere eglandulosa.
- d) *Submurorum* Zahn, in Koch Syn. l. c. Habitu *H. silvatici*.
- a) *Atratum* Zahn.

Subspecies **dolichaetum** Arv.-T. et Chenev., Bull. Soc. bot. Genève IX p. 9; Zahn, in Schinz et Keller, Flora d. Schw. ed. 2 II (1905) p. 314; non Koch Synops. (1901) p. 1850; *H. atratum eualpestre* Zahn, in Koch Syn. p. 1847. — Caulis 25—45 (—50) cm altus, superne mediocriter (0,5—1 mm), inferne subdense pilosus, 2,5 mm. Folia rosularia exteriora elliptico-v. oblongo-spathulata obtusa rotundata, interiora oblonga v. oblongo-lanceolata acutiuscula v. breviter acuta, exteriora cito, interiora sensim in petiolum alatum angustata, mollia, lutescenti-sordideque viridia, raro subpurpureo-colorata, supra disperse pilosa, 0,5 mm, subtus modice molliterque pilosa, 0,5—1 mm, in margine nervoque dorsali et in petiolo dense pilosa, 1—2,5 mm; et disperse glandulosa, leviter sinuato-denticulata v. plerumque dentata, dentibus numerosis, caulina 2 oblongo-lanceolata v. lanceolata pluridentata, interdum tertium folium caulinum evolutum, lineare, vel in formis humilibus unum tantum evolutum. Acladium 15—50 mm longum, rami

primarii 1—5, interdum ex omni ala orti arcuato-erecti simpliciter ramosi, capitula (2—) 3—7 (—12). Involucrum (9—) 10—11 mm longum ovatum, squamae subangustae acutiusculae v. acutae (exterioribus multo angustiores), subnigrae, mediocriter pilosae, sat dense glandulosae, fere effloccosae. Pedunculi consimiles, superne obscure cani. Flores saturate lutei, ligulae apice sparsim ciliatae.

H. atrato typico Sudetorum in Alpibus respondens, usque ad 2300 m ascendens.

Variat: $\alphagenuinum Zahn, in Schinz et Kell., Fl. d. Schweiz (1905) p. 315. Folia fere aequaliter sinuato-denticulata vel -dentata, mollia; involucra pedunculique modice pilosa.$

- a) *verum* Zahn l. c. Capitula 2—6. — Helvetia: Simplon (Favre, Chenevard etc.), in alpe Esserze (Wolf), in convallibus Binntal, Blitzinger-, Selkinger-, Eginen- et Gerental (Favrat, Lager etc.), Riederalp (Bernoulli), Eggischhorn, Oberwald—Grimsel—Maienwand—Furka (Chenevard, Favrat etc.); Göschener Alpe, Innertkirchen-Guttannen, Gotthard (Gisler, Thellung, Christener); Tannenalpe in v. - b) *helveticum* Zahn, in Koch Syn. (1901) p. 1847. Rami simpliciter vel dupliciter ramosi, capitula minora numerosiora ad 15 evoluta, inflorescentia indeterminata. — Helvetia: Eginen- et Gerental (Lagger sub nom. *nigrescens*).

Aliae formae in Tirolia: Galtür (Zimmerer), Vent in v. Oetzal (Wettstein), Stallsims in m. Glungezer (Murr), Pfitscher Jöchl (v. Heufler), Rittener Horn (C. v. Hepperger), Grödner Jöchl (de Benz), Marbe in v. Mühlwald (Treffer), Ahrntal (Ausserdorfer), Weitfeld pr. Luttach, Göge in v. Weissenbach (Treffer), in alpe Nemes pr. Sexten (Huter), Hofalpe et Gössnitz pr. Lienz (Scheitz), Schleinitz et Thurneralpe: Gamsstallwand pr. Lienz (Gander), Bergeralpe in v. Virgental (Ausserdorfer), Tschamp pr. Kals (Huter).

- β) **pseudonigrescens** Zahn in Koch Syn. p. 1847 p. p.; Schinz et Kell., Fl. d. Schweiz ad 2 II (1905) p. 314; Hierac. d. Schw. (1906) p. 389. Caulis haud raro ad 50 cm altus ad 10-cephalus; folia radicalia \pm rigidiuscula oblona obtusa v. oblono-lanceolata v. lanceolata acuta, in petiolum plerumque sat brevem breviter longeve attenuata, \pm grosse v. profunde inciso-dentata v. argute subserrato-dentata, multidentata, saepe elongata. Involucrum 9—10,5 mm longum, squamae, pariter ac pedunculi, tantum disperse pilosae sed plerumque densissime longeque glandulosae.

- a) *verum* Zahn, foliis subpilosis. — Eginental (Zahn), Maienwand (Favrat), Schächental: Griestal (Correns); Val Piora (Bernoulli); Engadina: Maloja-Forno (Touton), Samaden (Candrian), Scarltal (Schröter); Rhaetia: Lugnetztal: Ruinas neras et alpe Sezner supra Lumbrein (Steiger).

- b) *subhirsutum* Zahn, Hierac. d. Schweiz p. 389, foliis subovato-lanceolatis brevioribus, in parte superiore sat dense rigidiusculeque pilosis, caulino saepe uno tantum evoluta, ligulis dense ciliatis. — Maienwand (Zahn).

- γ) **Uschianum** Zahn, Hierac. d. Schweiz (1906) p. 389. Folia rosularia exteriora

abrupte in petiolum contracta, pariter ac interiora irregulariter et valde grosse serrato-dentata, dentibus saepe acuminatis; involucrium 12 mm longum denique depressum semiglobosum, squamis e basi lata acuminatis acutiusculis v. acutissimis. Folium caulinum plerumque unum. Capitula 3—5. — Rhaetia: In valle Sertig prope Davos 1900 m (Zahn).

Tab. 144, Fig. A. 1—4. *H. atratum* Fr. ssp. *dolichaetum* A.-T. *a) genuinum a) verum* Zahn (in v. Eginental legi). 1. Apex ligularum. 2. Squama. 3. Pedunculus sub involucrio. 4. Foliorum margo.

Subspecies **zinkenense** Pernhoffer, Hierac. Seck. exs. II (1895) no. 102 et Oesterr. bot. Zeitschr. (1896) p. 237; Zahn, in Koch Syn. (1901) p. 1847. — Caulis ad 25 cm altus tenuis, breviter subpilosus, superne subfloccosus et subglandulosus, basin versus ± effloccosus eglandulosusque, sed densius longiusque pilosus, 3—4 mm. Folia radicalia subparva sat longe petiolata late lanceolata v. pleraque lanceolata utrimque attenuata acuminata acutiuscula v. acuta, obscure sordide viridia, argute denticulata v. subserrato-dentata, utrimque et in margine sparsim glanduloso breviter subpilosa, in nervo dorsali petioloque modice longiusque pilosa, 3—4 mm; caulina 1—3 alato-subpetiolata v. basi angustata sessilia, radicalibus similia, superiora lineari-lanceolata subtus subfloccosa. Inflorescentia indeterminata 2—5-cephala, acladium 10—60 mm longum, rami primarii ad 4, plerumque tantum 1—2, remoti. Involucrium (8—) 10—11 mm longum ovatum, modice breviterque pilosum, sat dense minuteque glandulosum, subeffloccosum, squamae subangustae acuminatae. Pedunculi canescentes, pilis obscuris apice dilutis subpilosi, disperse mediocriterve glandulosi. Flores saturate lutei sparsim ciliati.

Stiria: In m. Seckauer Zinken (Pernhoffer), Hühnerkar pr. Wald (Khek), Teichengraben in m. Zeyritzkampel (de Benz), Türkentörl pr. Gleinalpe (Preissmann), Stuhleck (G. Beck), Häuselealpe in m. Hochschwab (de Benz); Austria inferior: Vorauerschwaig in m. Wechsel 1450 m (G. Beck); Carinthia: Koralpe (de Benz).

Tab. 144, Fig. B. *H. atratum* Fr. ssp. *zinkenense* Pernh. (ex alpe Häuselealpe m. Hochschwab, leg. de Benz). 5. Squama. 6. Pedunculus sub involucrio.

Huic gregi etiam subspecies sequentes inserendae sunt:

1) Subspecies **atratum** (Fries l. c.) Zahn, in Koch Syn. (1901) p. 1847, squamis atherimis e basi latiuscula acuminatis obtusiusculis v. acutiusculis, capitulis (1—) 2—4 (—7) semiglobosis 11—12 mm longis, foliis radicalibus exterioribus obovato-spathulatis apice rotundatis, interioribus oblongis v. lanceolatis, in petiolum longum sensim angustatis, acutis v. obtusiusculis, tantum supra basin profundius dentatis v. tantum denticulatis, caulinis 1—2 late v. anguste lanceolatis acutis. — In Sudetis et in Tatra.

2. Subspecies **ihrowyszczense** Zahn. — Caulis 30—35 cm altus arcuato-erectus, maculatus, breviter subpilosus, superne dense floccosus minuteque glandulosus, usque ad inferiorem tertiam partem subfloccosus. Folia radicalia numerosa elliptica et acutiuscula v. ovato- v. oblongo-lanceolata et ± longe acuminata, in petiolum ± alatum cito sensimve angustata, dilute subluteo-viridia, glanduloso-serrato-dentata, basi dentibus grossioribus munita, utrimque breviter subpilosa, in margine petioloque disperse minuteque glandulosa, novella dense pilosa, intima in nervo dorsali subfloccosa; caulinum 1 lanceolatum glanduloso-dentatum, in parte aversa disperse, in nervo dorsali sat dense floccosum. Acladium 10 mm longum, rami 3 remoti, ordines axium 3, capitula 4—7. Involucrium crasse ovato-cylindricum 12—14,5 mm longum, pilis modice numerosis brevibus obscuris, glandulisque densis obsitum,

squamae atrae sublatiusculae acutiusculae v. acutae apice barbulatae, exteriores basin versus in margine disperse floccosae, interiores viridi-submarginatae. Pedunculi densissime longeque atroglandulosi sparsim pilosi dense floccosi, caulomata superne obscure glandulosa sparsim pilosa. Flores saturate lutei, apice breviter ciliati, stylus subobscurus.

In montibus Wysoka et Kiputa ad flumen Lomnitz prope Podluty in Carpathis Galiciae (Wołoszczak)!

Verosimiliter formulae (*transsilvanicum*—*silvaticum*) > *alpinum* respondens.

Variat: β) **amphitrichum** Zahn, foliis utrimque molliter pilosis, caule usque ad basin floccoso, capitulis magnis pariter ac pedunculi dense glandulosi et pilis modice numerosis atris brevibus obsitis. — In m. Ithrowyszcze ad fl. Lomnitz (Wołoszczak).

Annotatio: Subspeciem gletschense Zahn, Hierac. d. Schweiz (1906) p. 389 et f. *subfloccosum* variationis β) speciei *dolichaeti* l. c. nunc *H. rauzensi* adscribo.

b) **Polycephalum** Zahn.

Subspecies **polycephalum** Velenovsky, Oesterr. bot. Zeitschr. (1883) p. 390; Zahn, in Koch Syn. (1901) p. 1848; *H. atratum* 3) **robustum** G. Schneider, in „Das Riesengebirge in Wort und Bild“ Heft 49 et 50 (1893) p. 25. Caulis (25—) 40—60 cm altus gracilis strictus 2—3 foliatus, a medio v. interdum iam supra basin ramos 2—4 (—6) elongatos arcuato-ascendentes evolvens, praecipue basin versus subpilosus, saepissime viridis. Folia dilute gramineo-viridia subtenuia mollia, radicalia 3—6 magna oblongo-lanceolata v. lanceolata utrimque attenuata, v. oblonga basi fere truncata, rigidiuscule subpilosa, in margine \pm sparsim glanduloso grosse arguteque dentata, basin versus grosse inciso-dentata, dentibus apice longe glanduliformibus saepe in petiolum descendentibus; caulina \pm alato-petiolata longe acuminata, praecipue basin versus longe arguteque (fere dupliciter) dentata, summa plerumque basi angustata sessilia. Inflorescentia paniculata valde suprafastigiata, acladium brevissimum v. ad 40 mm longum, capitula 8—25, ordines axium 3 (—4). Involucrum 13—14,5 mm longum, squamae lineari-lanceolatae nigrae, interiores viridi-submarginatae, omnes pariter ac pedunculi dense floccosi glandulis numerosissimis pilisque dispersis canescentibus nigris immixtis obsitae, apicem versus subglabrae, caulomata subglandulosa. Ligulae apice subciliatae. Achaenia initio rufo-brunnea, denique subatra.

In montibus Asciburgensibus in declivitatibus graminosis inter 12—1400 m: Kesselkoppe, Kiesberg, Ziegenrücken, Kleine Schneegrube (Velenovsky), Silberquelle, Gehänge, Mezerlehne, Kleiner Teich (G. Schneider), Seiffenlehne (A. Schultz).

Verosimiliter formulae *Fritzei* > *silvaticum* v. *nigritum*—*silvaticum* respondens, sed *H. atrato* typico Sudetorum valde simile.

c) **Schroeterianum** Zahn.

Subspecies **Schroeterianum** Zahn, Hierac. d. Schweiz (1906) p. 390; *H. dolichaetum* ssp. *dolichaetum* Zahn, in Koch Syn. (1901) p. 1850; nec A.-T. Caulis (15—) 20—35 (—40) cm altus, tantum basin versus sparsim disperse pilosus, fere usque ad basin floccosus, superne densissime longeque glandulosus, usque ad basin modice glandulosus. Folia radicalia numerosa petiolata, exteriora parva, obovata v. elliptica obtusa, reliqua maiora oblongo-lanceolata v. lanceolata obtusiuscula v. acuta, omnia cito v. pleraque sensim in petiolum angustata, denticulata v. leviter sinuato-dentata v. argute grosseque serrato-dentata, dilute v. saturate viridia, mollia v. subrigidiuscula, utrimque pilis dispersis v. modice numerosis brevibus,

0,5—1 mm, in parte superiore rigidiusculis, in petiolo ad 1—2 mm longis obsita; caulina 2—4 cito v. \pm sensim decrescentia, inferius saepe subpetiolatum, sequentia basi angustata vix breviter alato-petiolata, lanceolata, summa lineari-lanceolata v. linearia; omnia folia in margine mediocriter sat longeque glandulosa, superiora dense v. densissime glandulosa saepe fere pilosa et etiam in parte superiore aversaque glandulosa, subtus saepe \pm floccosa. Acladium brevissimum v. ad 35 (—65) mm longum, rami primarii 1—3 (—4) remoti erecti, simpliciter v. dupliciter ramosi, capitula 2—7 (—12). Involucrum (8,5) 9—10 mm longum ovatum denique basi truncatum. Squamae subangustae obtusiusculae v. acutae nigrae, interiores dilute marginatae fere effloccosae, v. sat dense floccosae, densissime obscureque glandulosae pilosae. Pedunculi \pm cani densissime longissimeque glandulosi pilosi. Flores lutei, ligulae apice \pm ciliatae, stylus luteus v. obscurus. Achaenia subatra.

Variat: α) **genuinum** Zahn, Hierac. d. Schweiz p. 390. Folia denticulata v. dentata.

1) normale Zahn l. c. Involucrum nigrum fere effloccosum.

- a) *verum* Zahn l. c. Folia lata, interiora oblongo-lanceolata. — Helvetia: Eginental, Maienwand, Furka, Realp (Favrat, Correns, Zahn); Rhaetia: Val Sertig (Zahn), Ochsenalp pr. Chur, Val Fondei (Wilczek), Dischmatal (Muret), Schlapiner Joch, Kübliser Alpe, Silvrettaalpe (Brügger); Albula (Muret), Val Fex, Muottas pr. Samaden, Val Bevers, Bernina, Schafberg (Rübel, Braun), Val Roseg (Muret etc.); Buffalora, Scarlital (Brunies, Schröter), Alp Suot in valle Tuoi, Murtera supra Boscha, Muot del hom supra Guarda (Bernoulli); Val Foscagno pr. Bormio (Longa). Camoghé (Jäggli). — Vorarlbergia: In iugo Arlberg (Murr). — Tirolia: Galtür in valle Paznaun (Zahn); in iugo Fedaja (Harz).
- b) *angustifolium* Zahn l. c. Folia rosularia interiora lanceolata v. anguste lanceolata saepe valde elongata, caulina subtus subfloccosa, involucrum semiglobosum. — Eginental 2300 m (Zahn).
- c) *stenodontum* A.-T., apud Zahn, in Schinz et Kell., Fl. d. Schweiz ed. 2 II (1905) p. 315. Folia brevissime dentata lanceolata. — Albula (Muret); Tirolia: Rosskogel 1800 m (Murr); Italia bor.: inter Bormio et Livigno (Longa).
- d) *melanadenium* Zahn, Hierac. d. Schw. l. c. p. 391, involucris pedunculisque nigroglandulosi, foliis caulinis angustis effloccosis. — Inter vallem Fedoz et Sils (Touton).

β) **heterodontum** Zahn l. c. p. 391, foliis irregulariter grosse v. inciso-dentatis, dentibus interdum longis angustisque.

- a) *verum* Zahn l. c., foliis in parte superiore subglaucescentibus, caulinis 2, inferiore pectinato-dentato, summo lineari. — Maienwand (Chenevard), inter Sils et Fuorcla Surlej (Touton).
- b) *subfloccosum* Zahn l. c., foliis caulinis 3, summo lineari-lanceolato v. lineari, squamis modice v. sat dense floccosis. — In valle Sertig pr. Davos (Zahn); sub m. Geisspitze v. Gauertal Vorarlbergiae (Murr).
- c) *dolichaetiforme* Zahn, in Koch Syn. (1901) p. 1854, foliis radicalibus numerosissimis oblongo-v. ovato-lanceolatis, exterioribus \pm cito in petiolum angustatis obtusis, reliquis sat magnis valde grosse dentatis, in margine

nervoque dorsali et in petiolo albo-villosis, involucris sat dense floccosis.

— In valle Sertig pr. Davos 19—2100 m (Zahn).

Exsiccata: C. H. Zahn, Hieraciotheca Europaea no. 276 (α 1 a).

c. Submurorum Zahn.

Subspecies **samnaunicum** Zahn, in Koch Syn. (1901) p. 1848; Hierac. d. Schw. (1906) p. 391; *H. murorum* var. *subatratum* A.-T. in sched. Caulis c. 30 cm altus, inferne subpilosus, superne pariter ac involucria et pedunculi densissime glandulosus. Folia rosularia ovata v. oblongo-lanceolata, a medio ad basin profunde serrato-dentata v. irregulariter grosse dentata, basi truncata v. ± in petiolum contracta, dilute viridia subglaucescentia v. subcinerascens-viridia, supra parcepilosa v. glabra; caulinum 1 radicalibus interioribus simile, interdum pectinato-dentatum. Acladium 20—50 mm longum, rami primarii 3 (—4), ordines axium 3—4, capitula 2—10 (—20). Involucrium 10 mm longum ovatum, squamis angustis acutiusculis v. acutis obscuris ± effloccosis, interioribus dilute marginatis. Stylus subluteus v. obscurus.

In ditone *H. atrati*. Helvetia: Eginental (Chenevard), Maenwand, Eggischhorn (Bernoulli), in iugo Simplon, Hohbühl supra Algabi (Chenevard); Val Muschenas pr. Scans (Candrian); Samnaun (Kaeser); Tirolia: Kreuzberg pr. Sexten, inter iugum Rolle et Cimon della Pala, inter Schludersbach et Plätzwiesen (A. et K. Touton).

Tab. 148. *H. atratum* Fr. ssp. *samnaunicum* Zahn (e valle Samnaun: Compatsch, leg. Kaeser). 1. Pedunculus sub involucrio. 2. Squama. 3. Foliorum margo.

Subspecies **dolichaetoides** Zahn, in Koch Syn. (1901) p. 1848; Hierac. d. Schw. (1906) p. 391. Caulis ad 50 cm altus usque ad basin ramosus, superne sat dense et plerumque sat longe glandulosus, inferne disperse pilosus. Folia rosularia ovalia v. oblonga, exteriora plerumque basi cordata apice rotundata obtusa, interiora abrupte in petiolum subtenuem angustata ± acuminata, omnia dilute viridia, a medio v. iam ab apice ad basin dentata, basi valde grosse et late dentata, supra fere pilosa, in margine petioloque modice pilosa, 0,5—2 mm; caulinum ovato-lanceolatum v. lanceolatum breviter petiolatum, interdum 2 evoluta, summum lineare. Acladium ad 50 mm longum, rami 3—4 valde remoti, inferior saepe cauliforme, ordines axium 3 (—4), capitula 7—15; reliqua ut in ssp. *samnaunico*, sed involucria plerumque submaiora longius glandulosa.

Formulae *Schroeterianum*—*silvaticum* respondens.

Helvetia: Maloja, Celerina, Sils-Surlej, Val Bevers (A. et K. Touton), Sertigtal pr. Davos (Zahn).

Tab. 147. *H. atratum* Fr. ssp. *dolichaetoides* Zahn (in valle Sertig legi). 1. Squama. 2. Pedunculus sub involucrio. 3. Portio e caulis medio. 4. Foliorum margo.

In „Hieracien der Schweiz“ (1906) p. 392 iam duas alias subspecies descripsi: Ssp. **sasellae** Tout. et Zahn, foliis ovato-lanceolatis glaucescentibus, in parte superiore setoso-subpilosis, pedunculis involucriisque densissime glandulosis, in rupibus Crap Sasella pr. Samaden *Engadiniae* superioris a cl. A. et K. Touton lecta, et Ssp. **Coazii** Zahn, capitulis pedunculisque disperse

modiceve pilosis mediocriter glandulosis ab aliis subspeciebus gregis *Submurorum* praecipue diversa, a Candrian pr. Samaden et in valle Muschenas pr. Scanfs inventa.

88. Hieracium Krašani Woł., Trzeci Przyczynek do flory Pokucia, in Sprawozdań komisji fizyograficznej Akademii Umiejetności, tom. XXV (1890) p. 64; = **alpinum—transsilvanicum** Woł. l. c.

Subspecies **Krašani** Woł. l. c. Rhizoma crassum saepe pluricaule. Caulis gracilis 18—30 cm altus phyllopodus, viridis, inferne rubro-violaceus, superne dense floccosus, ubique sat dense pilosus, pilis dilutis sat mollibus 2,5—3,5 mm longis, apicem caulis versus basi nigricantibus et glandulis atris subnumerosis immixtis. Folia rosularia numerosa oblongo-v. lanceolato-spathulata obtusa v. obtusiuscula ad 10:1,5 cm longa, basin versus longe sensimque in petiolum late alatum saepe sat brevem angustata, gramineo-viridia, subintegerrima v. remote leviterque sinuato-denticulata saepe subundulata, exteriora glabrescentia, reliqua utrimque dense molliterque pilosa, 2—4 mm, in margine mediocriter glandulosa et pariter ac in nervo dorsali petioloque densius pilosa subvillosa, novella subpellita; caulina (1—) 2—3 (—4) oblongo-lanceolata v. lanceolata oblique patentia, inferius acutiusculum longe in petiolum late alatum brevem attenuatum, superiora ± longius acuminata basi angustata subsessilia, in bracteas angustas lineares abeuntia. Inflorescentia ± furcata, acladium 15—40 mm —¹/₂ totius caulis longum, rami primarii 1 (—3) oblique erecti graciles, ordines axium plerumque 2, capitula 1—3 (—4). Involucrum 12—13 mm longum semiovatum, squamae adpressae latiusculae acuminatae acutiusculae v. acutae, nigricantes, *dense glandulosae, pilis subobscuris* brevibus *modice numerosis* obsitae, effloccosae. *Pedunculi* graciles 3—4 bracteis linearibus, inferioribus 2 subfoliaceis lineari-lanceolatis obsiti, pariter ac caulomata *mediocriter obscureque pilosi* et sat dense glandulosi, cani. Flores aureolutei, ligulae apice parum ciliatae fere glabrae, *stylus obscurus*.

Carpathes orientales: In cacumine m. Siniak inter flumina Pruth et Bistrzyka 1660 m inter parentes absque aliis Hieraciis rarissime (Wołoszczak!), in m. Popad ad flumen Lomnica (id.); Marmaros: in m. Pietrosz (Pantocsek!).

Tab. 150, Fig. A. 1—3. *H. Krašani* Woł. ssp. *Krašani* Woł. (e m. Pietrosz). 1. Squama. 2. Pedunculus sub involucro. 3. Foliorum margo.

Subspecies **kukulense** Woł. et Zahn; *H. Krašani* Woł. p. p. Rhizoma saepe pluricaule. Caulis c. 20 cm altus tenuis viridis, in inferioribus duabus partes sat dense pilosus, superne dense floccosus subglandulosus, usque infra medium deminute floccosus, usque ad basin glandulis solitariis obsitus. Folia rosularia numerosissima oblongo-spathulata v. spathulato-lanceolata, sat longe petiolata, petiolo basi late vaginanti, ad 8:1,3 cm longa, obtusa v. acutiuscula, intima acuta, omnia dilute viridia, in petiolum longe attenuata, leviter sinuato-emarginata et glanduloso-dentata, utrimque pilosa, in margine modice glandulosa et pariter ac in nervo dorsali petioloque dense molliterque pilosa; caulina lanceolata, inferiora longe in basin petioli-formem attenuata, media brevius angustata, superiora lineari-lanceolata v. linearia. Acladium 12—20 mm longum, rami primarii 3—4 usque ad basin descendentes monocephali, capitula 2—3 (—5). Involucrum gracile cylindrico-ovatum 9—10,5 mm longum *densissime glandulosum effloccosum, pilis solitariis atris obsitum*, squamae subangustae atrae, interiores subdilute submarginatae. Pedunculi subtenues densissime glandulosi plerumque epilosi dense floccosi. Flores dilute v. ± saturate lutei, dentes ligularum sparsim ciliati, *stylus luteus*, denique luteo-brunneus, achenia brunnea.

Variat: *α*) **genuinum**, ut supra. — In m. Kukul ad montes Czorna hora Carpathorum Galiciae orientalis. (Wołoszczak!).

β) **subkrašani**, foliis dilute sublutescenti-viridibus, *utrimque densissime molliterque pilosis*, subdenticulatis vix undulato-marginatis; acladio 5—12 mm longo, ramis 2 (—4), superioribus 2 saepe tantum evolutis, caule plerumque 3-cephalo; involucris mediocriter pilosis. — Eodem loco.

Subspecies **suhardense** Woł. et Zahn. Rhizoma subtenue unicaule. Caulis tenuis 20—25 cm altus, superne disperse obscureque pilosus et modice floccosus, usque ad medium glandulis atris brevibus densissimis obsitus et viridi-ater, usque ad basin sat dense glandulosus et pilis densis basi obscuris mollibus obsitus, fere usque ad basin parcefloccosus. Folia radicalia complura (c. 5) petiolata cum petiolo 5—8 cm longa, 8—12 mm lata, obovato-spathulata v. spathulato-oblonga v. spathulato-lanceolata, apice rotundata obtusa v. acutiuscula, lutescenti-viridia, utrimque dense molliterque pilosa, in margine nervoque dorsali et in petiolo densius pilosa et modice tenuiterque glandulosa, pilis ubique brevibus; caulina 3—5, plerumque 3 maiora, reliqua bracteiformia, inum late alato-petiولاتum, lanceolatum, breviter acutum, basin versus longe sensim attenuatum, proximum basin versus sensim angustatum sessile, tertium linearilanceolatum; omnia *integerrima* vel *subtiliter denticulata*. Acladium 3—5 mm longum, rami primarii 5 (—6) remoti paulum suprafastigiati oblique patentes subflexuosi monocephali, ordines axium 2, capitula 5 (—6). Involucrum sat parvum ovatum basi rotundatum 8—9 mm longum atrum, squamae latiusculae acutiusculae v. acutae, atrae viridi-marginatae, densissime glandulosae, disperse v. submodice obscureque pilosae, effloccosae, glandulis longioribus brevioribus immixtis. Pedunculi densissime glandulosi disperse pilosi modice floccosi, glandulis pilisque atris. Flores lutei, dentes ligularum breves, obscurius lutei, ciliati, ligulae semitubulosae, stylus luteus denique brunnescens, ex tubo exsertus, achaenia denique obscure brunnea.

H. transsilvanico magis affine, habitu *H. atrati*.

In cacumine m. Suhard, solo schistoso, 1709 m, inter *H. alpinum* et *transsilvanicum* (Wołoszczak, 4. VIII!).

Subspecies **rotundiceps** Pantocsek et Zahn, Mag. bot. lapok (1907) p. 221. Caulis 25—35 cm altus tenuis v. gracilis, usque ad basin, superne sat dense floccosus, ubique pilis mollibus albis, 1—2 mm, basin versus ad 3—4 mm longis subpilosus et glandulis brevibus tenellis dispersis obsitus, erectus parum flexuosus, subtiliter striatus; rhizoma saepe pluricaule, v. caulis primarius basi 1—3 caules laterales evolvens. Folia radicalia ± longe tenuiterque petiolata, exteriora minora ovalia obtusa mucronata, reliqua ad 12 cm longa ovato-lanceolata, elliptico-lanceolata acutiora, v. interiora lanceolata longe acuminata, omnia cito, interiora sensimve in petiolum angustata, remote denticulata v. interdum subdentata rarius dentata, utrimque pilis in parte superiore rigidiusculis subtus mollioribus 1—3 mm longis subpilosa, superne saepe minus pilosa in margine nervoque dorsali et in petiolo densius pilosa (folia novella subsericea) et praecipue in margine glandulis tenellis dispersis obsita; caulina 2—3 lanceolata, in nervo dorsali v. in tota parte aversa subfloccosa, basin versus longe angustata v. folium medium brevius angustatum, longe acuminata, summum linearilanceolatum elongatum; inferiora basi subdentata, dentibus apice glanduliformibus. Inflorescentia altifurcata, acladium 10—30 mm longum, rami primarii 2—4 valde remoti erecti saepissime mono-, rarius 2—3-cephali; capitula 2—8. Involucrum 8—9 mm longum ovato-

globosum, squamae obscurae angustae acutae, pilis sat densis basi atris apice dilutis, 1—1,5 mm longis, glandulis dispersis et basin versus floccis dispersis subnumericisve obsitae, apice eximie barbulatae; interiores dilutius submarginatae. Pedunculi \pm tomentosi sat dense breviterque pilosi, 1—2 mm, disperse glandulosi, bracteis 1—3 obsiti. Flores lutei, ligulae apice breviter ciliatae, stylus denique obscurus, achaenia atra.

Habitu *H. atrati*, sed foliis sat magnis mollioribus more *H. transsilvanici* pilosis, capitulis minoribus gracillimis, squamis angustis acutis etc. differt.

Com. Marmaros Hungariae: In pratis alpinis m. Nagy-Pietrosz versus vallem Bucuiescu 18—2000 m (Filarszky et Jávorka, 22. VII 1906!), in regione Mughl m. Pietrosz (Pantocsek).

90. Hieracium rauzense Murr, Deut. bot. Monatschr. (1897) p. 281; Zahn, in Koch Syn. (1901) p. 1893; Hierac. d. Schweiz (1906) p. 392; = **alpinum** < **bifidum** Zahn, Hierac. d. Schw. l. c.

Caulis (15—) 25—35 (—40) cm altus tenuis v. gracilis saepe \pm flexuosus, superne dense floccosus et disperse v. fere mediocriter breviterque pilosus, usque ad basin floccosus, inferne subdensius pilosus, basin versus saepe pariter ac foliorum petioli \pm violaceus, ubique sparsim glandulosus v. fere eglandulosus. Folia rosularia pauca v. numerosa, petiolata, exteriora minora ovalia v. oblonga et \pm obtusa, reliqua ovato- v. oblongo-lanceolata \pm acuminata acuta, interdum lanceolata, omnia in petiolum breviter v. pleraque longe angustata, leviter sinuato-dentata v. sinuato- v. inciso- et grosse dentata, dentibus saepe numerosis varie magnis, in parte superiore parcepilosa, 0,5—1 mm, subtus disperse pilosa, 1—2 mm, in margine nervoque dorsali sat dense pilosa, 1—2 mm, in nervo dorsali plerumque \pm floccosa, in margine

semper glandulis minutis solitariis praedita, in petiolo basin versus sat dense v. dense pilosa, 2—2,5 mm, dilute viridia saepe ± glaucescentia, per exsiccationem facilius lutescentia, saepissime subrigida; caulina 2 (—3), inferius radicalibus interioribus simile, saepe grossius dentatum, basi angustatum vix petiolatum, summum lanceolatum v. anguste lanceolatum v. longe subulatum. Inflorescentia altefurcata saepe ± squarrosa, indeterminata, acladium 2—7 (—12) cm longum, rami primarii 1—4 oblique patentes rigidi, inferiores longi, interdum caules laterales evoluti, ordines axium 2—3, capitula (2—) 3—10. Involucrum crasse ovatum, initio saepe oblongo-ovatum, (10—) 11—13,5 (—15) mm longum, squamae e basi latiuscula acuminatae obtusiusculae v. acutae v. acutissimae, subatrae, ± dense floccosae canescentes, in margine saepe canotomentosae, praeterea submodice v. sat dense obscureque glandulosae, disperse v. modice pilosae. Bractee 2—3 parvae. Flores lutei, stylus obscurus, dentes ligularum parum ciliati, achaenia subatra.

Valesia superior, Engadina et Helvetia australis, Vorarlbergia, Tirolia, Carinthia, Transsilvania, Carpathes. — Flor. Iul.—Aug.

Ab *H. atrato* praecipue foliis saepius ± glaucescentibus, inflorescentia squarroso-ramosa, involucris pedunculisque dense floccosis sed minus glandulosis etc. differt.

1. Folia supra maculata.

Subspecies **maculifrons** Deg. et Zahn, Mag. bot. lapok (1906) p. 72. Folia rosularia numerosa elliptica v. oblonga obtusa, basi in petiolum alatum breviter angustata v. utrimque subattenuata mucronata, caulina 2—3 lanceolata, superiora in nervo dorsali subfloccosa, omnia glanduloso-denticulata dentatave, supra violaceo-submaculata subpilosa v. subglabra gramineo-viridia, subtus subpilosa, in petiolo dense pilosa. Caulis subpilosus, 1—2,5 mm, superne dense floccosus. Capitula 3—7.

In m. Oecsém teteje pr. Balánbánya, comitat. Csík Hungariae (de Degen).

1* Folia supra haud maculata.

2. Involucra pedunculique disperse sparsimve glandulosa sat dense diluteque pilosa, 1—2 (—3) mm, squamae angustae acutissimae, acladium 10—12 cm longum.

Subspecies **megalocladum** Zahn, Hierac. d. Schw. (1906) p. 393. Folia rosularia sat magna late lanceolata longe in petiolum angustata, infra medium dentibus nonnullis grossis munita, utrimque (superne rigidiuscule) disperse pilosa, in margine disperse glandulosa; caulina 2—3, summum longum lineare, medium anguste lanceolatum longum denticulatum, imum radicalibus interioribus simile. Rami longissimi, inferiores saepe repetito-flexuosi. Caulis usque ad basin modice pilosus, 2—3,5 mm. Involucrum canescenti-albidum.

In rupium fissuris pr. Wirl in valle Paznaun superiore (Kükental, Zahn).

Tab. 151, Fig. B. 3—5. *H. rauzense* Murr ssp. *megalocladum* Zahn (e loco classico legi). 3. Squama. 4. Pedunculus sub involucri. 5. Foliorum margo.

2* Involucra pedunculique disperse v. sat dense glandulosa, pilis brevioribus minus densis ± obscuris obsita, squamae partim obtusiusculae v. acutiusculae, acladium dimidio brevius.

3. Pili involucri pedunculorumque numerosiores v. aequae numerosi quam glandulae.

Subspecies **rauzaense** Murr l. c. Caulis disperse breviterque pilosus usque ad basin dense floccosus. Folia rosularia plerumque numerosa (ad 10), interdum florendi tempore pauca tantum non emarcida, exteriora elliptica ± obtusa, pleraque ovato- vel oblongo-lanceolata ± acuminata acutiuscula v. acuta, subcito subsensimve in petiolum angustata, breviter longeve petiolata, utrimque disperse pilosa, 0,5 mm, v. glabrescentia, viridia saepe subglaucescentia, in margine disperse glanduloso et in petiolo sat dense pilosa, 0,5—2,5 mm, dentata

vel serrato-dentata, pluridentata; caulina plerumque 2 (—3) ± lanceolata acuta basi attenuata subpetiolata v. subsessilia, summum lineari-lanceolatum v. lineare ± floccosum. Acladium 2—5 (—8) cm longum, rami elongati rigidiusculi. Involucrum densissime floccosum obscure cinereum, pilis (pariter ac in pedunculis) obscuris basi aterrimis. Stylus in planta, ut praeceptum est exsiccata, luteo-brunneus.

Variat: 1) normale a) *verum*. — Helvetia: In valle Eginen et ad meridiem glaciei Rhône-gletscher in declivitatibus infra viam (Zahn), in valle Piora: Bucca di Fongio (Bernoulli), in alpe Quadrella, Motto Minaccio 2000 m, in alpe Ribbia, Pizzo Molinera 2100 m (Chenevard); Engadina: inter Sils et Isola (A. et K. Touton), in v. Fedoz 19—2000 m (etiam forma pathologica microcephala), Maloja (Bernoulli); Vorarlbergia: in iugo Schlapiner Joechl (Grادل), pr. Rauz in iugo Arlberg, loc. classico! b) *pilosus* Zahn, Mag. bot. lap. (1907) p. 221, caulomatibus paulo densius pilosis, capitulis paulo minoribus. — Marmaros Hungariae: In regione Mughî m. Pietrosz (Pantocsek).

2) floccinervum Zahn, Mag. bot. lap. l. c., foliis in parte superiore disperse breviterque pilosis et praeterea in nervo mediano (supra!) subfloccosis. — Marmaros: In regione Mughî m. Repede (Pantocsek).

Exsiccata: Hieraciotheca Europaea No. 64.

Tab. 152. *H. rauzense* Murr ssp. *rauzaense* Murr (e loc. classico, leg. Murr). 1. Dentes ligularum. 2. Squama. 3. Pedunculus sub involucri. 4. Foliorum margo.

Subspecies **gletschense** Zahn, Hierac. d. Schw. (1906) p. 389 (sub *H. atrato*). Caulis 25—40 cm altus ubique submodice pilosus, superne floccosus disperseque glandulosus, inferne subeffloccosus sparsissimeque glandulosus. Folia radicalia oblongo-spathulata obtusa v. oblongo-lanceolata, saepe magna, 8—20 cm longa, petiolis dimidio brevioribus, utrimque cito longissimeve angustata, dentibus numerosis longioribus brevioribus immixtis, apice glanduliformibus munita, dilute viridia subglaucescentia mollia, supra fere epilosa, subtus disperse, in margine petioloque modice molliterque pilosa, 0,5—2 mm, caulina 2, inferius rhomboideo-lanceolatum v. lanceolatum utrimque longe attenuatum subpetiolatum irregulariter subgrosseque pluridentatum, summum longum lineari-lanceolatum v. lineare. Acladium 5—7 cm, rami 2—3 valde remoti longi, saepe etiam 1—2 e caulis basi orti, ordines axium 3, capitula 2—6 (—8). Involucrum 10—12 mm, squamae angustae *acutiusculae* v. *acutae* subatrae, mediocriter v. in margine sat dense floccosae, pariter ac pedunculi *modice obscureque pilosae et mediocriter, pedunculi sat dense sat longeque nigro-glandulosae*, interiores viridi-submarginatae. Flores sat breves, stylus subater.

Formulae pseudocirritum > alpinum = [(*bifidum-cirritum*) > *alpinum*] melius quam formulae *bifidum* > *alpinum* respondens, sed *H. rauzaensi* habitu et characteribus omnino simile.

Subspecies **pseudarolae** Murr, apud Zahn, in Koch Syn. (1901) p. 1850. Caulis ad 25 cm altus brevissime subpilosus, fere usque ad basin dense floccosus et sparsim glandulosus. Folia radicalia submagna, exteriora ovalia v. elliptica ± obtusa, basi abrupte in petiolum contracta, reliqua ovato-vel oblongo-lanceolata saepe longe petiolata subcito v. longius in

petiolum subalatum attenuata, basin versus grosse arguteque dentata, viridia subglauescentia, utrimque disperse breviterque pilosa v. glabrescentia, in margine sparsim glandulosa, novella tantum dense breviterque et subrigidiuscule pilosa. Acladium 2—4 cm, rami 1—3 erecti 1 (—2) cephalii, involucrium ad 12 mm longum, squamae sublatiusculae *obtusiusculae*, v. *interiores* ± *acutae*, obscurae v. atrovirides ± dense canofloccosae, pilis *modice numerosis* v. *interdum dispersis* basi atris et *glandulis dispersis* v. *interdum subnumerosioribus* obsitae. Pedunculi consimiles, dense canofloccosi. Flores aureolutes, ligulae apice ± ciliatae, stylus denique obscurus.

Tirolia: In alpe Stallsims 1700 m m. Glungezer pr. Innsbruck (Gremblach), in valle Laengental pr. Praxmar (Pöll).

Tab. 151, Fig. A. 1, 2. *H. rauzense* Murr ssp. *pseudarolae* Murr (ex alpe Stallsims, leg. Murr). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies **farinifloccum** Deg. et Zahn, Mag. bot. lap. (1906) p. 73. Caulis ad 25 cm altus, brevissime parceque pilosus, usque ad basin subfloccosus, superne *farinaceus* et sparsim glandulosus. Folia radicalia numerosa, exteriora multo minora elliptica obtusissima, interiora oblonga v. lanceolata acutiora, omnia basi abrupte inaequaliterque (v. intima subsensim) in petiolum subalatum contracta, denticulata v. dentata, supra subglabra pallide viridia, subtus et in petiolo breviter subpilosa et saepe paulum violaceo-colorata, in margine sparsim glandulosa; caulina 1—2 lanceolata v. angustiora, in nervo dorsali (v. summum in tota parte aversa) ± dense floccosa. Capitula 3—5, squamae ± floccosae angustae acutiusculae v. acutae. Pedunculi *albido-tomentosi*, pariter ac involucra subpilosi subglandulosi. Flores saturate lutei, ligulae apice parum ciliatae, stylus ± obscurus.

Comit. Csík Hungariae: in m. Oecsam-teteje pr. Balánbánya (de Degen); Galicia: In m. Czywczyn ad fl. Schwarzer Czeremosz, 1580 m (E. Wołoszczak).

Subspecies **bifidellum** Zahn. Caulis ad 35 (—40) cm altus breviter subpilosus, superne ± floccosus et sparsim glandulosus. Folia rosularia subnumerosa, exteriora minora elliptica v. ± lanceolata obtusa v. ± acuta, interiora ovata v. elliptica v. ovato- v. elliptico-lanceolata v. (intima) lanceolata, obtusiuscula v. acutiora v. acuminata, basi truncata v. abrupte v. ± sensim in petiolum subalatum angustata, dentata v. praecipue a medio ad basin grosse dentata, dentibus saepe ± triangularibus, inferioribus in petiolum ± descendentibus, rarius tantum denticulata, supra ± glabra v. breviter subpilosa saturate v. sordide viridia, subtus parcepilosa, in margine nervoque dorsali saepe parcefloccoso densius ciliata (1—2 mm), in petiolo sat dense pilosa, praeterea in margine glandulis nonnullis parvis obsita; caulinum 0—1 lanceolatum dentatum v. lineare longe acuminatum subtus subfloccosum. Inflorescentia *H. bifidi*. Acladium 10—25 mm longum, rami primarii 3—4 valde remoti, ordines axium 3, capitula (2—) 3—7 (—12). Involucrium 9—11 mm longum ovatum, squamae obtusiusculae v. acutae subangustae, ± dense (in margine densius) floccosae disperse breviterque pilosae subglandulosae, glandulis maioribus parvis immixtis; pedunculi canotomentosi sat breviter subpilosi disperse mediocriterve glandulosi. Flores saturate lutei, ligulae apice fere glabrae v. breviter subciliatae, stylus obscurus.

Habitu omnino *H. bifidi* Kit., sed foliis in margine (etiam in nervo dorsali petioloque) sparsim glandulosis praecipue differt.

Hab. Helvetia: Maienwand (Steiger); Vorarlbergia: In valle Gauertal pr. Schruns (Murr); Tirolia: In m. Rosskogel (Murr); in iugo Staller Sattel (de Benz); Stiria: Frauen-

alpe pr. Murau (Fest), Turracher Höhe (Oborny); Silesia: Kl. Schnee-grube Sudetorum, sol. basaltico (Callier).

♂) **kondraczkae** Wol. et Zahn, foliis utrimque breviter sat denseque pilosis, caulinis 1—2, pedunculis et squamis sat dense pilosis, submodice glandulosis, ligulis subciliatis. — Tatra Polonica: Kondraczka, 2000 m.

Tab. 155. *H. rauzense* Murr ssp. *bifidellum* Zahn (e v. Gauertal, leg. Murr). 1. Squama. 2. Pedunculus sub involucrio. 3. Foliorum margo. 4. Caulis portio.

3* Pili involucri pedunculorumque valde minus copiosi quam glandulae.

Subspecies **aroliflorum** Murr et Zahn, in Allg. bot. Zeitschr. (1904) p. 101 (pro ssp. *H. arolae*); *H. dolichaetum* var. *aroliflorum* Murr, Die Hierac. d. Arlbergs, in 44. Jahrb. Bregenzer Mus.-Ver. (1908) p. 44. Huc pertinet etiam *H. Vollmanni* 2) *brachyanthum* M. et Z., in Koch Syn. (1901) p. 1853 et in Hierac. d. Schw. (1906) p. 403. *H. rauzensis* ssp. *rauzensi* valde simile; foliis caulinis 1—3, inferioribus saepe sat magnis, radicalibus ovato- v. oblongo-lanceolatis ± longe serrato- et pluridentatis similibus, summo lineari-lanceolato v. lineari; acladio 30—55 mm longo; capitulis 2—6, involucris ad 15 mm longis semiglobosis, squamis sublatiusculis acutiusculis v. acutis subatris, obscure disperseque pilosis, dense sat longeque obscure glandulosis, *disperse sparsimve floccosis*. Reliqua ut in ssp. *rauensi*.

Variat: 1) normale, floribus evolutis conspicuis saturate luteis. — In iugo Arlberg supra 1600 m, praecipue versus hospitium St. Christof (Murr).

2) *brachyanthum* Murr et Zahn l. c., floribus tubulosis apice saepe debilibus abbreviatis ± stylosis. — In iugo Arlberg: pr. Rauz et St. Christof (Murr); in valle Samnaun Helvetiae (Käser).

Subspecies **semiatratum** Zahn, Hierac. d. Schweiz (1906) p. 394. *Transitus rauzense—atratum*. Caulis usque ad basin subglandulosus. Folia rosularia oblongo-lanceolata, fere omnia acuminata acutaque, brevius longiusve in petiolum alatum angustata, valde irregulariter dentata, dentibus numerosis longis lanceolatis v. linearibus antrorsum versis apice obtuse glanduliformibus brevioribus immixtis; caulina 2, inferius plerumque longius dentatum quam radicalia, summum lineare. Pedunculi glandulis sat densis sublongis atris pilisque obscuris dispersis muniti, dense floccosi, capitula consimilia, modice v. sat dense floccosa. Reliqua ut in ssp. *rauensi*.

Helvetia: Ad meridiem glaciei Rhône-gletscher in declivitatibus versus viam (Zahn).

Tab. 154. *H. rauzense* Murr ssp. *semiatratum* Zahn (leg. ipse). 1. Squama. 2. Pedunculus sub involucrio. 3. Foliorum margo.

Species intermediae:

98. Hieracium Bicknellianum Arv.-Touv. et Belli, in herb. Bicknelliano = **amplexicaule—Lawsonii** Zahn.

Rhizoma crassum eriopodum. Caulis ad 35—40 cm altus gracilis erectus substrictus substriatus phyllopodus. Folia rosularia numerosa submagna, exteriora minora saepe emarceida (rhizoma infra folia vaginis veteribus foliorum destructorum obtectum), elliptico-vel oblongo-lanceolata, breviter acuminata acutiuscula v. acuta, basin versus longius sensim in petiolum late alatum angustata v. attenuata sessilia, fere integerrima vel denticulata subglaucescenti-viridia, utrimque et praecipue in parte aversa pilis distincte denticulatis sublongis subcrispis ± dense obiecta, in nervo dorsali petioloque praecipue basin versus pilis longioribus sat dense pellita, *praeterea in margine nervoque dorsali glandulis dispersis minutis munita*; caulina (0—) 2 (—3) cito decrescentia sat parva, inferius profunde insertum, radicalibus simile, basi angustata sessile v. subamplexicaule, summum ± lanceolatum v. bracteiforme. Inflorescentia furcato-oligocephala (2—) 3—5 (—12) cephalis, acladio ad 5 cm longo, ramis primariis (1—) 2—3 (—4) valde remotis arcuato-ascendentibus, inferiore interdum ex rosula orto, ordines axium 2—3. Involucrium 12 mm longum crasse ovatum denique ventricatum basi truncatum; squamae e basi latiuscula longe acuminatae acutae, apice barbatae, obscurae, (praecipue interiores) dilute marginatae, sat dense sublongeque pilosae subeffloccosae disperse glandulosae. Pedunculi dense floccosi modice pilosi ± dense glandulosi; caulis modice, inferne densius pilosus, subglandulosus, superne subfloccosus. Flores saturate lutei, extus subpilosi, dentibus distincte ciliatis, stylis luteis; achaenia bruno-atra, 3,5 mm longa. — Flor. Iul., Aug.

H. Lawsonii Vill. propius quam *H. amplexicauli*; ab *H. Lawsonii* praecipue foliis disperse glandulosis differt.

Italia borealis. Liguria: „Pietra vecchia“ in Valle „Nervia“ ad meridiem iugo „Col di Tenda“ (Bicknell, Biancheri).

Tab. 171. *H. Bicknellianum* A.-T. et Belli (e loco class., leg. Biancheri). 1. Apex ligularum. 2. Squama. 3. Pedunculus sub involucrio. 4. Foliorum margo. 5. Pilus e margine foliorum.

99. Hieracium pedemontanum Burnat et Gremli, Cat. Hierac. Alp. Marit. (1883) p. 27; Arv.-Touv., Hier. Alp. franç. (1888) p. 48; *H. Valbonnense* A.-T., Notes (1883) p. 18; = **amplexicaule** > **lanatum**.

Caulis 15—30 cm altus sat dense pilosus, superne subfloccosus, usque ad basin subglandulosus, basi eriopodus, phyllopodus. Folia canescenti-viridia, interdum subglauescentia, radicalia compluria, sat magna, ovato-lanceolata, dentata v. \pm grosse dentata, acutiuscula vel acuta, basin versus longius attenuata late alato-petiolata, utrimque sat dense pilosa et subglandulosa, pilis patentibus mollibus *subplumosis* albidis, in margine nervoque dorsali basin versus densioribus; caulina 3 (—4) plerumque subcito decrescentia, inferiora radicalibus similia v. diminuta sessilia basi saepe subsemialexicaulia. Inflorescentia altefurcata saepe valde indeterminata, acladio ad 6 cm longo, ramis primariis 1—4 saepe ex omni ala ortis 1—3 cephalis paulum suprafastigiatis oblique erectis saepe subflexuosis subsquarrosis, ordines axium 2—3, capitula (1—) 2—5 (—12), interdum caules 1—2 laterales evoluti sunt. Involucrum (10—) 11—13 mm longum obscurum, squamae e basi sublatiuscula attenuata acuta, apice barbulata, sat dense glandulosa, disperse sat longeque pilosa, basin versus disperse floccosa. Pedunculi dense floccosi glandulosique subpilosi vel subpilosi, rami consimiles, subpilosi, longiores saepe foliis parvis muniti. Bractee c. 3, subfoliolaceae parvae. Flores lutei, ligulae apice ciliatae, stylus luteus achaenia atrobrunnea. Alveoli in margine saepe parum fibrilloso-ciliati. — Flor. Iulio, Aug.

Habitu *H. pulmonarioidis* Vill. v. *H. petraei* Hoppe, sed differt foliis subcrassioribus subglauescentibus v. canescentibus, pilis albidis manifeste denticulatis v. subplumosis obsitis, minus dense glandulosus, involucris praeter glandulas pilis longis simplicibus obsitis. Ergo *H. pedemontanum* Burnat et Gremler primum transitum inter *H. amplexicaule* L. et *H. lanatum* Vill. esse ad interim opinionem habeo. Huc pertinet etiam *H. plumiferum* N. P. II p. 322.

Hab. in Alpibus Maritimis Italiae: Col di Tenda: la Briga, S. Dalmas, V. Casterino, V. Nervia, Pietra Vecchia (Burnat, Bicknell, Boissier), Pic d'Ormea, inter Ponia rocca et Mendatica, Carnino; S. Martin-Lantosque, V. Libaré, Madone de Fenestre (Burnat). Gallia: Col Lacroix, Château-Queyras, le Valbonnais au Désert (Arvet-Touvet).

Tab. 172. *H. pedemontanum* Burnat et Gremler (Pietra Vecchia in v. Nervia, leg. Biancheri). 1. Apex ligularum. 2. Squama. 3. Pedunculus sub involucro. 4. Foliorum margo.

sind

Kannglessner, Dr. Fr., Die Etymologie der Phanerogamen-Nomenclatur. — Eine Erklärung der wissenschaftlichen, der deutschen, der französischen, englischen und holländischen Pflanzennamen. Preis geheftet M. 3.85, gebunden in Leinen M. 5.—.

Die rein wissenschaftliche Arbeit ist mit einleitendem Text und ausführlichem Literaturnachweis versehen. Die Pflanzen werden nach dem offiziellen Gattungsnamen alphabetisch abgehandelt, und wo nur irgend möglich, mit den Worten der alten griechischen bezw. römischen Schriftsteller, deren naturwissenschaftliche, medizinische Vertreter sämtlich auf etymologische Notizen hin durchgearbeitet worden sind, erklärt.

Migula, Prof. D. W., Neue Kryptogamenflora. Flechten, Moose, Algen und Pilze Bd. II. 2. Teil der Algen liegt komplett vor. Broschiert M. 18.75, gebunden in Halbfranz M. 22.50.

Nach Fertigstellung dieses Bandes liegen die Algen, welche ganz ausführlich behandelt wurden, komplett vor. — Die Reihenfolge der einzelnen Abteilungen hat eine kleine Änderung erfahren, indem auf Wunsch vieler Kunden jetzt erst die Pilze erscheinen. Die erste Doppellieferung ist bereits erschienen. — Nach Fertigstellung dieses Bandes wird damit wohl ein Werk geschaffen sein, welches auf dem Gebiete der Pilze einzig dastehen wird. Besonders grossen Wert legt der Autor auf die Illustrationen und liefert die erste Lieferung dafür den Beweis. Dieselbe steht Interessenten zur Ansicht jederzeit zur Verfügung.

Die früheren Bände der Migula'schen Kryptogamenflora.

Band I Moose komplett brosch. M. 17.—, geb. Halbfranz M. 19.—,

Band II Algen 1. Teil brosch. M. 31.50, geb. Halbfranz M. 35.—.

Sectio XIV: Prenanthoidea

Sectio XIV. **Prenanthoidea** [Fr., Epicr. 7 et 118; Koch, Syn. ed. 2 p. 528; Arv.-T., Monogr. p. 44; Zahn, in Koch Syn. (1901) p. 1862; Hierac. d. Schw. (1906) p. 15 et 419; *Prenanthoidea Genuina* et *Lanceolata* Arv.-T., Essai classif. 11, 12; *Prenanthea* Arv.-T., Hierac. Alp. franç. p. 193. — Plantae elatae in partibus superioribus (praecipue in pedunculis) dense glandulosae, aphyllopodae. Folia caulina numerosa, eglandulosa (rarius in margine glandulis solitariis inconspicuis obsita), ima basin versus angustata, media basi lata sessilia v. \pm amplexicaulia, basin versus saepe \pm panduriformia, omnia in parte aversa reticulato-venosa. Capitula parva v. mediocriter magna, saepe numerosa. Squamae distincte multiseriales et regulariter imbricatae, interiores obtusae. Ligulae apice \pm ciliatae. Achaenia dilute v. rubro-brunnea.

103. Hieracium prenanthoides Vill., Prosp. (1779) p. 35; Fl. Delph. (1785) p. 85; Hirt. pl. Dauph. III (1789) p. 108; Voyage (1812) p. 58, tab. 3 fig. 3. — In Pyrenaeis, Arverni montibus, in m. Jurasso, in Vogesis, in Silva Nigra, per totum Alpium tractum, in Sudetis, Carpathis, in montibus Balcanicis, in Aprutiis, in Caucaso, Rossia, Scandinavia, Scotia. — Iul., Aug.

Dispositio gregum:

* Squamae minus latae obtusaeque, omnes usque ad apicem glandulosae.

- a. *Prenanthoides* Zahn, in Schinz et Kell., Fl. d. Schw. ed. 2 II (1905) p. 320. Folia \pm integerrima, plerumque \pm mollia, late ovato-oblonga, basi profunde cordata amplexicaulia. Inflorescentia \pm squarrosa ramosissima indeterminata, pariter ac involucri cylindrico-ovatum glandulis subtenuibus dilutis densissimis obsita, epilosa. Achaenia straminea. — Huc pertinent *H. prenanthoides* Vill. sensu strenuo et *H. Jaquetianum* Zahn.
- b. *Bupleurifolium* Zahn l. c. Folia subintegerrima v. denticulata saepe \pm rigidiuscula, haud raro \pm panduriformia basi profunde cordata auriculata amplexicaulia. Inflorescentia minus ramosa indeterminataque, capitulis minus numerosis maioribus. Involucra, pedunculi et rami glandulis densis sat longis obscuris simul saepe pilis solitariis v. in ramis pedunculisque sub-numerosioribus obsita. Squamae subangustae. Achaenia dilute v. saepe \pm rubro-brunnea. — Huc pertinent p. e. *H. perfoliatum* Froel. et *H. bupleurifolium* Tsch.

** Squamae \pm latae subatrae, interiores obtusissimae, in margine apiceque \pm glandulosae.

- c. *Lanceolatum* (Vill.) Z. l. c. Folia plerumque \pm rigida, media ovato- v. oblongo-lanceolata v. lanceolata v. angustiora, basi aequilata \pm amplexicaulia v. parum auriculata, haud v. indistincte panduriformia, denticulata v. dentata v. serrato-dentata, subtus minus reticulato-venosa. Caulis plerumque crassiusculus rigidusque. Squamae plerumque modice tantum glandulosae et disperse obscureque pilosae. Caulomata consimilia. Ligulae apice parum ciliatae \pm vel glabrae. Achaenia denique brunneo-atra. — Huc pertinent p. e. *H. lanceolatum* Vill. (sensu strenuo, *H. strictissimum* Froel., *H. melanotrichum* Reuter, *H. praeruptorum* Gren. Godr., *H. Spennerianum* Zahn, *H. pseudoleiopsis* M. et Z., *H. Fieckii* Uechtr. etc.

a. *Prenanthoides* Z.

Subspecies **Jaquetianum** Zahn, in Koch Syn. (1901) p. 1894 et in Schinz et Kell., Fl. d. Schw. ed. 2 II (1905) p. 320; Hierac. d. Schw. (1906) p. 421. Caulis ad 80 cm altus saepe ± crassiusculus, in summa tertia parte dense glandulosus epilosusque. Folia caulina ad 15 v. compluria, sat magna, ovato- v. elliptico-lanceolata, inferiora saepe subpanduriformia, media superioraque profunde cordata amplexicaulia, auriculis inter se contingentibus, late ovata, omnia acuminata mollia denticulata, utrimque disperse modiceve, in margine dense pilosa (1 mm), summa glandulis valde solitariis obsita. Inflorescentia valde squarrosa, saepe ad $\frac{1}{2}$ totius caulis descendens, ramis arcuato- v. subhorizontaliter patentibus basi tantum sparsim pilosis densissime lutescenti-glandulosis. Acladium ad 20 mm longum, capitula pauca v. numerosissima, involucrium 8—10 mm longum, squamae subangustae, obscure canae albido- viridi-marginatae, modice floccosae epilossae densissime glandulosae, pedunculi consimiles, cani.

Habitu inflorescentiae *H. ramosissimo* Schl. haud dissimile.

Helvetia. Valesia: Pacoteires 2000 m, Ecône (Besse), inter Grengiols et Binn (Jaquet), Hochmatten pr. Binn (Chenevard), Kalpetran (Muret), in valle St. Nikolaus (Favrat), Chemin neuf supra Conthey (Wolf), in valle Triqueut supra Ardon 1100 m (Zahn); Klusalpe pr. Reidenbach in valle Simmental (Maurer). — Epinel in valle Cogne Florae Valdostanae (Wolf).

Tab. 175. *H. prenanthoides* Vill. ssp. *Jaquetianum* Zahn (pr. sacellum „Auf dem Platt“ inter Grengiols et Binn, leg. Jaquet). 1. Squama. 2. Pedunculus sub involucrio. 3. Foliorum margo.

c. *Lanceolatum* (Vill.) Z.

Subspecies **bupleurifolioides** Zahn, Hierac. d. Schw. (1906) p. 424; *H. lanceolatum* α) *multiglandulum* Zahn, in Syn. (1901) p. 1864. Caulis superne modice pilosus, pilis basi obscuris. Folia ut in *H. bupleurifolio* Tausch, ± ovato-lanceolata, basi profunde cordata, 2—3 longa quam lata, sed fere semper dentibus numerosis minoribus maioribusve munita, supra rigidiuscule subpilosa, media inferioraque basin versus distincte angustata. Involucrium minus quam in *H. lanceolato* typico, 9—10 mm longum, squamae subangustiores, interiores minus obtusae, sparsim modiceve floccosae, obscurae, pariter ac pedunculi ± obscure cani dense glandulosi et plerumque pilis obscuris solitariis munitae.

- Variat: 1) fuscum Zahn l. c. Squamae subatrae, pili in superiore plantae parte basi atri. — Helvetia: in iugo Oberalp (Bruegger), Tschams in v. Samnaun (Kaeser); in m. Vogesis, in m. Feldberg *Silvae Nigrae* (Zahn); Vorarlbergia: Supra Stuben ad viam versus Lech (Zahn) et pr. Rauz (Murr).
2) subcinereum Z. l. c. Squamis modice floccosis, pilis dilutioribus basi tantum obscuris. — Helvetia: Pacoteires supra Alesse (Besse) Valesiae; in iugo Bonaudon pr. Rochers-de-Naye (Lagger).
3) subepilosum Z. Involucrium et pedunculi plerumque epilosa dense glandulosa. *H. bupleurifolio* Tsch. proximum, sed squamis obscuris latioribus obtusis more *H. lanceolati* differt. — Helvetia: Oussannaz (Jaquet), Petit Mont, Bonaudon (Muret); in alpihus supra Bex (Muret); la Forclaz in valle d'Hérens (Wilczek); pr. Grindelwald (Christener).

Tab. 176. *H. prenanthoides* Vill. ssp. *bupleurifolioides* Zahn 1) *fuscum* Z. (e m. Arlberg,

leg. J. Murr). 1. Apex ligularum. 2. Squama exterior. 3. Squama interior. 4. Pedunculus sub involuero.

Subspecies **pseudoleiopsis** Murr, Österr. bot. Zeitschr. (1903) p. 423. Caulis rigidus inferne subpilosus, superne squarroso-ramosus. Folia caulina 8—15 sensim decrescentia, argute denticulata v. breviter serrato-dentata, papyracea v. subcoriacea, dilute viridia, supra glabra sublucida, subtus et in margine disperse breviterque pilosa, inferiora oblongo-lanceolata, in petiolum late alatum cito sensimve attenuata, media saepe ovato-lanceolata basin versus angustata sessilia ± amplexicaulia, summa basi late ovata semiamplexicaulia, omnia ± acuta. Capitula numerosa late cylindrico-ovata, squamis subatris obtusiusculis obscure viridi-marginatis, plerumque subfloccosis, subglandulosis, pilis obscuris solitariis obsitis. Pedunculi cani subglandulosi disperse pilosi. Flores saturate lutei, ligulae apice vix ciliatae, achaenia brunneo-atra.

Tirolia australis: In iugo Jaufen pr. Sterzing (leg. J. Murr).

Tab. 177. *H. prenanthoides* Vill. ssp. *pseudoleiopsis* Murr (e iugo Jaufen). 1. Squama. 2. Pedunculus sub involuero.

Subspecies **Fiekii** Uechtr., in Fiek, Fl. Schles. (1881) p. 280; *H. salicifolium* Uechtr., in Jahresber. Schles. Ges. vaterl. Kultur. (1874), nec Lindebg.; *H. striatum* var. *Fiekii* Arv.-T. in sched. Caulis (30—) 40—50 (—75) cm altus strictus rigidus crassiusculus cavus subtiliter striatus, inferne saepe rubro-coloratus, usque ad apicem dense foliatus, (1—) 4—8 (—20) cephalus, superne disperse glandulosus floccosusque, deorsum glabratus. Folia plerumque rigida, in parte superiore dilute viridia sublucida subglaucescentia, subtus pallidiora, plerumque distincte sed late reticulato-venosa, utrimque glabra v. interdum sparsim pilosa, in margine tantum sparsim breviterque, raro densius ciliata, vel summa omnino glabra. Folia caulina infima ± emarcida, late oblongo-lanceolata, in petiolum brevem late alatum basi parum amplexicaulem angustata, obtusiuscula; sequentia elliptico- v. ovato-lanceolata basi truncata v. cordata ± auriculataque, ± amplexicaulia, acutiuscula, media elliptico- v. late lanceolata, medio latissima, basi cordata auriculata semiamplexicaulia, acuta, summa ovato-lanceolata ± longe v. breviter acuminata acuta, basi truncata semiamplexicaulia; rarius media late elliptica magisque auriculata, omnia folia caulina remote denticulata, rarius dentata v. integerrima, summa tantum interdum profundius dentata. Inflorescentia ± determinata, rarius racemoso-paniculata, acladio plerumque brevissimo, ramis paucis subremotis 1-oligo-cephalis. Involucrum (10—) 11 (—12) mm longum late cylindrico-ovatum basi rotundatum, dense glandulosum, epilosum, sparsim, basi modice floccosum. Squamae sublatiusculae obtusiusculae atrovirides, exteriores immarginatae, mediae dilutius submarginatae, intimae sordide pallideque virides v. dorso obscuriores. Pedunculi sat dense subtenuiterque glandulosi, superne dense, deorsum deminute floccosi. Ligulae apice glabrae. Flores subaurei. Stylus obscurus.

Subspecies in Sudetis endema, 1250—1300 m: Kl. Schnee-grube haud raro, Melzer-grube, Teufelsgärtchen, Kiesberg (Fiek, Uechtritz, Pax, Wetschky).

Variat: 1) normale Z., capitulis pedunculisque tantum glandulosis.

2) sparsifolium Z., capitulis pedunculisque pilis solitariis obscuris obsitis.

Tab. 178. *H. prenanthoides* Vill. ssp. *Fiekii* Uechtr. (Kleine Schnee-grube, leg. Hirte). 1. Apex ligularum. 2. Squama. 3. Pedunculus sub involuero. 4. Foliorum margo.

Species intermediae:

104. Hieracium falcatum Arv.-Touv., Monogr. (1873) p. 22; Hier. Alp. franç. (1888) p. 19; *H. bupleuroides* B. *H. falcatum* A.-T. l. c.; *H. penninum* A.-T., Hier. Alp. fr. l. c., nec N. P. = **prenanthoides—bupleuroides** N. P., Monogr. II (1886) p. 71.

Subspecies **falcatum** (A.-T.) Z. Caulis 20—60 cm altus gracilis rigidiusculus striatus hypophyllopodus, apice, rarius usque infra medium ramosus. Folia caulina 6—10, ima oblongo-lanceolata v. lanceolata, media summaque e basi ovata sensim longeque acuminata, acuta, omnia sensim decrescentia rigida glauca integerrima v. obsolete denticulata. Inflorescentia laxissime paniculata saepe indeterminata, acladio 2—5 cm longo, ramis (0—) 1—3 (—5) oblique erectis monocephalis v. rarius simpliciter ramulosis, capitulis (1—) 2—5 (—7). Involucrum 10—12 mm longum ovatum, squamis latiusculis obtusis v. acutis, distincte imbricatis, obscuris, late viridi-marginatis, adpressis v. extimis sublaxis. Bractee 2—3, infimae interdum subfoliolaceae. Pili involucri sparsi v. modice numerosi basi obscuri, in caulomatibus nulli, in foliorum nervo dorsali et interdum etiam in margine foliorum inferiorum basin versus solitarii v. dispersi 2 mm longi. Glandulae in involucri solitariae v. dispersae, in pedunculis nullae v. apice tantum solitariae. Flocci involucri submediocriter numerosi, petioli superne albido-cani, deorsum cito deminute floccosi, caulomata cito effloccosa. Flores lutei, ligulae glabrae v. subciliatae, stylus obscurus, achaenia brunnea. — Aug.

Habitu *H. bupleuroidis* Gmel. Ab hac specie habet capitula, colorem foliorum et pilos ubique valde deminutos, ab *H. prenanthoidi* glandulositatem involucri, foliorum figuram et basin, praetera caulem hypophyllopodum.

Delphinatus: Lautaret, Galibier 2000 m, haud infrequens; Sabaudia 18—2000 m: Pointe de Marcelly et de Chalune, Crête de Roy (Briquet); ad meridiem iugi Col de Vernaz 15—1900 m, inter lacum d'Ervin et m. Billiat 18—1900 m (Briquet).

Exsiccata: Zahn, Hieraciotheca Europaea 184 a, 184 b, 282 (f. *angustifolium* A.-T.).

Tab. 179. *H. falcatum* A.-T. ssp. *falcatum* (A.-T.) Z. (e iugo Lautaret, leg. A. Faure). 1. Squama. 2. Pedunculus sub involucri.

Huc pertinet cum subspecie **H. glaucoides** Muellner, in G. Beck, Fl. Hernstein (1884) p. 447, tab. VIII fig. 2 b, e loco „Heuplagge“ 1600 m m. Schneeberg Austriae inf. (det. Muellner, 8. VIII. 1881)!

Alia species inter *H. prenanthoides* et *H. bupleuroides* intermedia, sed priori magis affinis, est **H. orthophyllum** G. Beck, Fl. Hernstein p. 448, tab. V fig. 1; Fl. N.-Österr. p. 1304; Zahn, in Koch Syn. (1901) p. 1865, e vallecula „Saugraben“ m. Schneeberg, 1500 m (det. 3. IX. 1882 G. Beck).

Delphinatus, Pedemontium, Jurassus, Alpes usque ad Vindobonam et Goritiam, Aprutii; Bosnia; Sudeti. — Iul., Aug.

Dispositio gregum:

1. Pedunculi disperse glandulosi, caulis plerumque plus 7 foliatus, pleiocephalus.

2. Caulis elatus gracilis v. crassiusculus, ramis ad 5 (—7) remotis. Habitu *H. prenanthoidi* magis simile.

a. Valdepilosum (Vill.) Z., Hier. d. Schw. p. 431. — Ssp. *valdepilosum*, *Grabowskianum* etc.

2* Caulis minus elatus, ramis minus numerosis. Habitu inter *prenanthoides* et *villosum* quasi intermedium.

b. Elongatum N. P. — Ssp. *elongatum*, *glabrescens* etc.

1* Pedunculi eglandulosi, caulis pleio- v. oligophyllus, plerumque oligocephalus.

3. Folia caulina pauca, media amplexicaulia v. late sessilia, caulis plerumque phyllopodus.

c. Oligophyllum N. P. — Ssp. *oligophyllum* etc.

3* Folia caulina media basi angustata, caulis dense foliatus, hypophyllopodus.

d. Christeneri N. P. — Ssp. *Christeneri*.

a. Valdepilosum (Vill.) Z.

Subspecies **Grabowskianum** N. P. II p. 207; *H. villosum* β) *intermedium* Grab., Fl. v. Oberschlesien p. 229; *H. villosum* β) *dentatum* Wimm., Fl. Schles. (1847) p. 305; *H. villosum* \times *prenanthoides* Uechtr., Österr. bot. Zeitschr. (1862) p. 86; Fiek, Fl. Schles. (1881) p. 280; Neilr., Krit. Zus. Hierac. (1871) p. 38. Caulis 15—35 cm altus rigidus, hypo- v. aphyllopodus. Folia rosularia 0 (—2), caulina 7—12 valde sensim decrescentia \pm oblongo-lanceolata, inferiora basin versus angustata, sequentia basi aequilata v. \pm panduriformia, media summaque basi lata rotundata v. cordata sessilia, omnia denticulata v. subsinuato-serratodentata. Capitula 1—5 (—10), acladium 10—15 mm, ordines axium 0—3, rami 1—3 (—5). Involucrum 13—15 mm longum, squamis conformibus, latiusculis, acutis, nigris dilute submarginatis, extimis tantum \pm laxis, minute subglandulosis, in margine disperse floccosis. Tota planta modice pilosa, caulis superne tomentosus, usque ad medium floccosus. Flores lutei, ligulae apice breviter ciliatae, stylus obscurus, achaenia brunnea.

Variat: 1) normale N. P. II p. 208. — Sudeti: In rupestribus faucis „Grosser Kessel“ 1430—1460 m in montibus „Mährisches Gesenke“ (Grabowski, Uechtritz, Oborny!).

2) longipilum N. P. I. c. Folia in parte superiore densius longiusque pilosa. — Tatra: Drechselhäuschen (Haussknecht).

Tab. 180. *H. valdepilosum* Vill. ssp. *Grabowskianum* N. P. 1) normale N. P. (e loc. class., leg. Oborny). 1. Apex ligularum. 2. Squama. 3. Pedunculus sub involucre. 4. Caulis portio.

H. Grabowskianum a cl. Naegeli-Peter propriam speciem inter *prenanthoides* et *villosum* hybridam esse declaratum est, sed omnibus characteribus subspeciebus *H. valdepilosi* (= *prenanthoides*—*villosum*) ita simile est, ut *H. Grabowskianum* huic speciei intermediae adscribere malim.

Subspecies **valdepilosum** Vill., Hist. pl. Dauph. III (1789) p. 106, tab. 30. Caulis ad 50 cm altus, gracilis v. crassiusculus, saepe \pm flexuosus, aphyllopodus. Folia caulina florendi tempore ad 12, inferiora oblonga, longe in basin attenuata, sed plerumque haud distincte petiolata, acuta, sequentia oblonga, sessilia v. subamplexicaulia, media summaque ovata basi

lata sessilia v. \pm amplexicaulia, omnia acuta fere integerrima v. denticulata v. breviter remote-que serrato-dentata, viridia, mollia. Acladium 2—3 cm longum, rami 2—5 remoti **graciles**, rarius ramulosi, capitula ad 8. Involucrum 13—14 mm longum semiglobosum, squamis latiusculis acutis atris anguste diluteque marginatis, extimis laxis. Bractee paucae lineares v. imae tantum lanceolatae. Pili ubique numerosi (1,5—) 3—4 (—6) mm longi. Glandulae in involucrio subnumerosae parvae, in pedunculis dispersae. Flocci in squamis dispersi, in margine subnumerosi, caulomata superne densissime, usque ad caulis medium deminute floccosa. Ligulae luteae breviter ciliatae, stylus obscurus, achaenia atro-brunnea.

18—2300 m. Italia bor.-occid.: Col di Tenda (Bicknell); Alpes Gallicae: Lautaret, les Grandes-Rousses, l'Oisans, le Chamoux, le Pelvoux; Mt.-Cénis, Hte-Maurienne, Pic de la Corne, le Chablais (Arv.-T.). Caulis 30—50 cm altus subtenuis v. gracilis v. subcrassiusculus, modice v. subdense pilosus, phyllopodus. Folia rosularia plerumque pauca, obovata v. oblongo-spathulata v. lanceolata, exteriora saepe obtusa, omnia breviter v. longe petiolata, dilute v. saturate viridia, saepe subglaucescentia, tenuia v. subrigidiuscula, denticulata v. \pm grosse dentata, in margine nervoque dorsali semper \pm dense pilosa, in parte aversa minus pilosa, supra haud raro glabrescentia; caulina 2—6 sensim vel \pm cito decrescentia, oblongo- v. ovato-lanceolata, inferiora breviter petiolata v. basi angustata subpetiolata, media summaque basi angustata sessilia v. basi lata rotundata v. cordato-ovata sessilia et \pm amplexicaulia, reliquis characteribus radicalibus similia. Inflorescentia furcata v. laxa paniculata \pm indeterminata, acladio 1—6 (—10) cm longo, ramis 1 v. paucis (rarius ad 7) monocephalis v. simpliciter ramulosis. Capitula 2—10 (—20), involucri parvum v. submagnum, habitu ut in *H. silvatico* v. ut in *H. valdepiloso*, 9—12 (—17) mm longum, squamis latiusculis v. angustis, acuminatis obtusiusculis v. acutis, exterioribus plerumque angustioribus. Pili in involucrio submodice numerosi brevesque vel \pm densi et longiores, in pedunculis dispersi v. modice numerosi. Glandulae in involucrio pedunculisque subnumerosae v. subdispersae, rarius tantum sparsae. Flocci involucri modice numerosi, pedunculi \pm canotomentosi, caulis saepe usque infra medium \pm floccosus. Bractee paucae v. complures, imae interdum subfoliolaceae. Flores varie lutei, ligulae apice \pm ciliatae, stylus dilutus v. obscurus, achaenia dilute v. obscure brunnea v. subatra.

In alpinis Delphinatus, Sabaudiae, Pedemontii, Helvetiae, Vorarlbergiae, Tiroliae, Carinthiae, Carniae usque ad Goritiam, Bosniae. — Flor. Iul., Aug.

Ab *H. valdepiloso* differt: caule phyllopodo plerumque apice tantum ramoso, foliis caulinis minus numerosis saepe magis cito decrescentibus, capitulis minoribus, pilis minus numerosis, glandulis numerosioribus.

H. porrectum Fr. subspeciebus *H. subelongati* valde affine est. Postero tempore *H. subelongati* formae forsitan melius sub nomine colectivo „*porrectum* Fr.“ coniungendae erunt.

Dispositio gregum:

- a) *Subelongatum* Zahn. *H. valdepiloso* magis affine: involucrio crasso 11—13 (—17) mm longo, inflorescentia plerumque altefurcata, capitulis parum numerosis disperse glandulosis sat dense pilosis, pedunculis subglandulosis. — Ssp. *alfenzinum* Evers, *subelongatum* N. P., *Wilczekianum* A.-T., *adenodontum* Zahn.
- b) *Pseudosilsinum* Zahn. *H. silvatico* magis affine, involucri subparvis v. mediocribus 9—11 mm longis, inflorescentia laxa paniculata pleiocephala, pilis minus numerosis brevioribusque, glandulis in involucrio pedunculisque subdisperse v. modice numerosis. — Ssp. *pseudosilsinum* Zahn, *sertigense* Zahn, *bagnense* Zahn, *muerrense* Zahn, *subdoronicefolium* Zahn.

a. Subelongatum Zahn.

Subspecies *alfenzinum* Evers (1883 in sched.), Österr. bot. Zeitschrift. (1893) p. 425; Zahn, in Koch Syn. (1901) p. 1873; Hierac. d. Schw. (1906) p. 612; *H. dentatum—vulgatum* Evers in sched. Caulis 30—50 cm, gracilis v. crassiusculus, sat dense pilosus (3—5 mm), usque ad basin floccosus. Folia rosularia 2—5, late lanceolata acuta, in petiolum \pm late

alatum sensim angustata, \pm grosse serrato-dentata, dentibus triangularibus prominentibus. saturate viridia glaucescentia; caulina (2—) 3—6 sensim decrescentia, saepe etiam valde grosse dentata, inferiora radicalibus similia, reliqua late v. ovato-lanceolata, basi \pm cuneata v. rotundata sessilia et saepe subamplexicaulia, superiora in nervo dorsali subfloccosa. Acladium ad 10 cm longum, rami 0—3 crassiusculi, 1 (—2) cephalis, capitula 1—5, squamae subangustae acutissimae atrovirides, pariter ac pedunculi cani pilis dilutis basi obscuris subvillosae et sparsim glandulosae, in margine tantum sparsim floccosae. Stylus obscurus.

Vorarlbergia: Ad torrentem Alfenz pr. Stuben in iugo Arlberg 1400 m (Evers), ad torrentem supra Rauz (Murr); St. Rochus versus Sareiser Joch (Richen, Murr).

Exsiccata: Zahn, Hieracioth. Europ. 285.

Tab. 198. *H. subelongatum* N. P. ssp. *alfenzinum* Evers (infra viam „Flexenstrasse“ leg. J. Murr). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies **Wilczekianum** A.-T. in sched.! et in Bull. herb. Boiss. (1897) p. 732; Zahn, Hier. d. Schw. (1906) p. 453; *H. Salaevense* var. *Mureti* A.-T. in sched. Caulis 30—40 cm altus disperse v. modice et molliter pilosus (1—2 mm), supra medium \pm floccosus, \pm furcato-ramosus, acladio 3,5—12 cm longo, ramis 2—3 (—4) remotis longis 1—3 cephalis oblique erectis; capitula 2—7. Folia rosularia pauca v. numerosa, petiolata, obovata v. oblongo-spathulata, obtusa v. breviter acuta, cito sensimve in petiolum attenuata; caulina remota, elliptico- v. oblongo-lanceolata, basi cuneata sessilia, superiora saepe anguste lanceolata, omnia dilute viridia saepe subglaucescentia, utrimque subpilosa, in margine nervoque dorsali et in petiolo densius pilosa (1—2,5 mm), irregulariter sinuato-dentata v. denticulata, haud raro 2—3 dentibus maioribus infra medium serrato-dentata. Involucrum 10—12 mm longum ovatum, denique depressum, squamis e basi sublatiuscula acuminatis acutis et acutissimis, subatris, praecipue in margine subfloccosis, sat dense pilosis (1,5—2 mm), disperse glandulosis. Pedunculi albidocani, modice breviterque pilosi, superne glandulis dispersis obsiti. Stylus subobscurus; achaenia brunneo-atra.

Helvetia: Ormonts: Arpille 2100 m (Wilczek), Creux de Champ (Zahn); au Nombrieux supra Le Levanchy (Favrat), Vallon de Nant (Wilczek), Canfin (Muret); ad limites Vaudensi-Friburgenses: Le Savigny 1700 m (Wilczek); Sabaudia: Rochers des Degrés de Platé pr. Sixt (Briquet).

Tab. 201. *H. subelongatum* N. P. ssp. *Wilczekianum* A.-T. (in circo giganteo rupium m. Diablerets, „Creux de Champ“ dicto, legi). 1. Squama. 2. Pedunculus sub involucrio.

b. *Pseudosilsinum* Zahn.

Subspecies **pseudosilsinum** Zahn, in Schinz et Kell., Fl. d. Schw. ed. 2 II (1905) p. 327 et in Hier. d. Schw. (1906) p. 455; *H. silsinum* Zahn, in Koch Syn. (1901) p. 1874 p. p.; *H. laetevirens* Zahn, in Jaquet, Contrib. fl. fribourg. (Mém. soc. frib., vol. I fasc. I 1901) p. 7; nec Sommier-Levier. Caulis 20—35 cm altus, mediocriter molliterque pilosus, fere usque ad basin subfloccosus, gracilis v. tenuis, altefurcato- 2—12 cephalus, acladio 10—35 mm longo, ramis primariis 1—7, inferioribus remotis 1—6 cephalis. Folia rosularia 1—3, oblonga v. oblongo-lanceolata, rarius elliptica, breviter v. longissime petiolata, longe in petiolum angustata, breviter v. sublonge acuminata, exteriora saepe obtusiuscula; caulina 2—4 (—5) subcito decrescentia, inferiora \pm longe attenuata subpetiolata, media basi paulum attenuata, superiora basi lata sessilia, omnia dilute viridia, utrimque submodice breviterque pilosa (1 mm), in margine nervoque dorsali et in petiolo densius pilosa (1—3 mm), denticulata v. dentibus grossis

apice glanduliformibus munita, in nervo dorsali effloccosa. Involucrum 9—10 mm longum denique late depressum, squamis angustis acuminatis obtusiusculis v. acutis, modice pilosis, subglandulosis subfloccosis, in margine dense floccosis; pedunculi subglandulosi subpilosi canotomentosi. Pili in involucrio pedunculisque basi atri. Stylus obscurus; achaenia brunneo-atra.

Helvetia. In alpebus Bernensibus: Niederhorn pr. Boltigen (Zahn), Nessli et inter Luchernalp et Reidigalp (Maurer), in valde Ueschinen pr. Kandersteg (A. et C. Touton); in alpeb. *Friburgensibus*: Neuschels et Kühboden supra Jaun, Les Merlas, Oussannaz (Jaquet).

Verosimiliter formulae *valdepilosum*- (*bifidum-silvaticum*) respondens.

Variat: 1) normale Zahn; robustius, foliis caulinis basin versus dentibus grossis apice longe glanduliformibus munitis. — Neuschels, Ueschinen.

2) *subdentatum* Zahn; debile, foliis denticulatis v. breviter dentatis. — Niederhorn.

Tab. 199. *H. subelongatum* N. P. ssp. *pseudosilsinum* Zahn (inter Reidigalp et Luchernalp legi). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies *sertigense* Zahn, Hier. d. Schw. (1906) p. 455. *H. pseudosilsino* satis affine, sed involucrum 12—13 mm longum, squamis e basi latiuscula acuminatis apice barbulatis, omnibus acutis, interioribus acutissimis, atris, in margine tantum subfloccosis, modice obscureque pilosis glandulosisque, pilis longis basi atris; pedunculi consimiles cano-farinacei; stylus obscurus.

Helvetia. In valle Sertig pr. Davos, ad occidentem loci „Hinter den Ecken“ dicti, 1920 m, in consortio *H. valdepilosi* ssp. *oligophylli* legi. Habitu *H. oligophyllo* subsimile, sed foliis radicalibus exterioribus oblongo-spathulatis ± obtusis saepe grosse dentatis et inflorescentia *H. silvaticum* in mentem mox revocans. Folia mollia sublutescenti-viridia.

Tab. 200. *H. subelongatum* N. P. ssp. *sertigense* Zahn (e loco classico). 1. Squama. 2. Pedunculus sub involucrio.

112. Hieracium iurassiciforme Murr = **valdepilosum—bifidum** Zahn. — Murr, apud Zahn, in Koch Syn. (1901) p. 1894 et in Hierac. d. Schweiz (1906) p. 457; *H. intybellifolium* Briquet, Bull. soc. Murith. fasc. XXVIII (1900) p. 31 et in Nouv. liste Eperv., Ann. Jard. bot. Genève (1901) p. 164; nec A.-T., Bull. herb. Boiss. V (1897) p. 735.

Caulis 30—50 cm altus gracilis saepe subascendens et subflexuosus, phyllopodus, saepe fere ad basin usque floccosus, disperse modiceve pilosus, 0,5—1,5 mm, basi (saepe violacea) sat dense pilosus. Folia rosularia ad 5, exteriora minora elliptico-spathulata ± obtusaque, interiora submagna oblongo-lanceolata acutiuscula v. acuta, exteriora cito, interiora sensim in petiolum ± alatum angustata, caulina ad 5 subito decrescentia, oblonga v. elliptico-lanceolata, inferiora basin versus attenuata, media basi breviter cuneata v. basi angustata sed rotundata sessilia, superiora basi saepe lata rotundata vix amplexicaulia, omnia ± glaucescenti- et saturate viridia v. dilute sublutescenti-viridia, supra parcepilosa v. caulina ± epilosa, subtus disperse pilosa, in margine nervoque dorsali semper densius longiusque pilosa, denticulata v. plerumque irregulariter grosseque serrato-dentata (*H. bifidi* dentes in mentem revocantia), caulina saepe in nervo dorsali ± floccosa. Inflorescentia laxa paniculata, 3—10 (v. pleio-) cephalis, acladio 5—25 (—50) mm longo, ramis paucis v. ad 5, infimis remotis, 1—3 cephalis; involucrum (9—) 10—12 mm longum ovatum denique latius, squamis subangustis acutiusculis v. acutis, subatris, in dorso modice v. sat dense floccosis, in margine ± albotomentosis, modice v. sat dense pilosis (1—2 mm), subsparsim glandulosis, pedunculi

ramique (et caulis superne) cano-farinacei v. albotomentosi, pedunculi submodice pilosi, superne sparsim glandulosi. Bractee 2—3 subulatae, in squamis exterioribus angustis transeuntes. Flores plerumque aureolutes, ligulis apice subglabris v. papillosis, stylus \pm obscurus, achaenia brunnea 3—4 mm longa.

Hab. in alpinis Lemnensibus Sabaudiae et in Vorarlbergia. — Flor. Iul., Aug.

1. Squamae obtusae v. interiores acutae, interiores viridi-marginatae apice saepe obscuriores; folia glaucescentia gramineo-viridia.

Subspecies **iurassiciforme** Murr l. c. Folia valde irregulariter grosseque dentata brevissime subpilosa. Caulis ad 60 cm altus subpilosus, capitulis 4—10 (—18), involucris modice tantum et breviter pilosis. — Inflorescentia fere ut in *H. bifido*, folia caulina ut in *H. subelongato*, c. 3—4 evoluta, inferiora et radicalia latissime et abrupte alata.

Ad torrentem Alfenz pr. Stuben et supra Rauz in iugo Arlberg Vorarlbergiae (J. Murr).

Tab. 204. *H. iurassiciforme* Murr ssp. *iurassiciforme* Murr (e loco classico, leg. Murr). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies **walfagehrensae** Murr, in 44. Jahresber. d. Bregenzer Museums pro 1906 (1908) p. 45. Folia caulina 1—2, radicalia dilutius viridia, interdum subviolaceo-colorata, molliter longiusque subpilosa. Capitula minus numerosa, acladium ad 5 cm longum, squamae acutiores modice v. subdisperse pilosae. — Habitu *H. bifido* magis affine quam ssp. *iurassiciforme*.

Tab. 202. *H. iurassiciforme* Murr ssp. *walfagehrensae* Murr (inter Rauz et Walfagehr in iugo Arlberg tantum in consortio ssp. *iurassiciformis* ab auctore detectum). 1. 2. Squamae. 3. Pedunculus sub involucrio.

- 1* Squamae longe acuminatae acutiusculae v. acutae, folia dilute viridia.

Subspecies **grandimontis** Zahn, Hier. d. Schw. (1906) p. 458; *H. intybellifolium* Briquet et A. T. p. p. l. c.; nec Bull. herb. Boiss. (1897) p. 735. Caulis 30—45 cm, capitulis 2—10. Folia dentata, subtus et praecipue in margine nervoque dorsali subdense pilosa, petiolo villosa (3 mm). Involucrium 11—13 mm longum sat dense diluteque villosum. Pedunculi albo-farinacei. — Inter 17—2100 m.

Variat: 1) *normale* Zahn, Hier. d. Schw. p. 458, foliis \pm grosse dentatis. — Helvetia austro-occid.: Inter m. Grammont et Les Jumelles (Briquet, Zahn); Sabaudia: Col de Savan, Pointe de Vésine, Pte de Chavache (Briquet).

2) *denticulatum* A.-T., in Briquet, Nouv. liste Eperv., Ann. Jard. bot. Genève (1901) p. 164, foliis denticulatis v. glanduloso-dentatis. — Grammont (Briquet).

Tab. 203. *H. iurassiciforme* Murr ssp. *grandimontis* Zahn (in iugo inter m. Grammont et Les Jumelles legi). 1. Squama. 2. Pedunculus sub involucrio.

113. Hieracium doricifolium Arv.-Touv. = **cydoniifolium—silvaticum** Zahn. — A.-T., Bull. soc. dauph. II (1875) p. 45, exsicc. 470; Hier. Alp. franç. p. 98; *H. denticulatum* Reuter exs. 1866 apud A.-T., Spicileg. p. 33, nec Sm.; *H. iurassicum* Gremli, Neue Beitr. p. 18 p. p.; *H. cydoniifolium—silvaticum* Zahn, in Koch Syn. (1901) p. 1875; Hier. d. Schw. (1906) p. 459.

Caulis 20—60 cm altus gracilis v. tenuis erectus parum flexuosus, phyllopodus v. hypophyllopodus, \pm intense striatus, subdense pilosus, saepe fere usque ad basin floccosus, superne plerumque subglandulosus. Folia rosularia nulla v. 2—6 evoluta petiolata, exteriora oblonga v. ovata, cito in petiolum angustata, interiora sensim in petiolum breviora v. longiora

alatum angustata, elliptica, oblongo v. obovato-lanceolata, obtusa v. acuta mucronata, subintegerrima, denticulata v. \pm remote dentata, saturate v. dilute viridia glaucescentia, subtus pallidiora, \pm indistincte reticulata, saepe \pm rubro-colorata, subrigida v. submolli; caulina 4—6 subremota subsensim decrescentia, radicalibus similia, inferiora basin versus angustata fere late alato-subpetiolata, superiora basi lata v. subcordata semiamplexicaulia, omnia utrimque modice v. sat dense pilosa, summa interdum in nervo dorsali subfloccosa. Inflorescentia laxepaniculata saepe \pm squarrosa, acladio 10—25 (—30) mm longo, ramis 2—6 inferioribus remotis oblique v. arcuato-erectis gracilibus v. tenuibus plerumque 1- (—2-) pliciter ramulosis. Capitula pauca v. ad 20, involucrum 10—12 mm longum denique ovatum basi rotundatum v. truncatum, squamis angustis v. sublatiusculis obtusiusculis v. acutiusculis, interioribus saepe \pm dilute marginatis, exterioribus obscuris, sat dense pilosis (1—2 mm), modice v. subdense glandulosis, modice v. (in margine) sat dense floccosis. Pedunculi consimiles, canii, caulomata subglandulosa. Flores \pm dilute lutei, ligulis apice ciliatis, stylis obscuris; achaenia dilute v. obscure brunnea.

Delphinatus, Sabaudia, Helvetia occidentalis, Carinthia. — Flor. Iulio, Aug.

In Hierac. d. Schweiz l. c. p. 460 tres subspecies descripsi: Ssp. *arpillense* Zahn, ssp. *doronicifolium* A.-T. et ssp. *dermophyllum* A.-T. et Briq.

Subspecies **doronicifolium** A.-T. l. c. Phyllopodum ad 40 cm altum, ubique subdense pilosum. Folia caulina 4—6, inferiora basin versus attenuata panduriformia, superiora basi aequilata sessilia et \pm amplexicaulia, omnia \pm lutescenti-viridia leviter denticulata. Capitula ad 12. Squamae angustae obtusiusculae v. acutae, interiores subviridi-marginatae, omnes pariter ac caulomata subdense pilosae glandulosaeque, in margine praesertim subdense floccosae.

Hab. Delphinatus: Mont Seneppe près La Mure 12—1300 m (Sauze), Lautaret: Villard d'Arène (A.-T.); Sabaudia: Dent d'Oche (Favrat); Helvetia: Gr. St.-Bernhard: Les Combes, Pradaz (Besse), Nessli pr. Reidenbach in valle Simmental (Maurer), Creux de Maischüpfen (Jaquet), Eisboden ad pedem m. Wetterhorn (Christener), Tornettaz in Ormonts (Steiger).

Exsiccata: Soc. dauph. no. 470; soc. franco-hélv. 304 (forma *calvescens*, foliis sparsim pilosis, dilute glaucescenti-viridibus, e iugo Col Vert prope Villard-de-Lans, Jsère, leg. Neyra).

Tab. 205 *H. doronicifolium* A.-T. ssp. *doronicifolium* A.-T. (Villard-d'Arène, leg. Neyra).

1. Apex ligularum. 2. Pedunculus sub involucro. 3. Squama.

Schw. p. 19 et in sched.!

Aphyllopodium, *hypophyllopodium* v. *phyllopodium*. Caulis 30—90 cm altus tenuis v. gracilis v. crassus, saepe \pm flexuosus, \pm intense striatus. Folia rosularia florendi tempore nulla, etiam folia caulina infima emarcida, vel rosularia emarcida, caulina inferiora florendi tempore virentia, vel pauca rosularia evoluta, elliptica v. oblonga v. lanceolata, in petiolum \pm longum v. longissimum cito v. \pm sensim angustata, raro \pm integerrima, plerumque \pm dentata v. grosse dentata, obtusiuscula v. acuta, \pm glaucescentia v. dilute v. saturate v. cano-viridia, subtus pallidiora et \pm distincte reticulata, interdum pariter ac caulis basis violaceo-colorata, \pm rigida v. mollia. Folia caulina 5—12 (—18) \pm sensim decrescentia, ima petiolata v. in petiolum late alatum cito sensimve angustata, media basi subangustata v. \pm panduriformia et \pm amplexicaulia, basi saepe auriculata, superiora basi lata v. \pm ovato-cordata sessilia amplexicaulia, omnia oblonga v. ovato-lanceolata, raro lanceolata, acuminata, \pm dentata, raro tantum denticulata. Inflorescentia \pm paniculata, \pm determinata v. indeterminata, saepe \pm squarrosa, vix suprafastigiata, plerumque polycephala, acladio (5—) 10—25 (—30) mm longo, ramis paucis v. numerosis et \pm remotis elongatis arcuato-squarrosis 1—2 (—3) pliciter ramulosis. Involucrum (8—) 9—10 (—11) mm longum, gracile v. crasse cylindrico-ovatum v. ovatum, basi rotundatum v. \pm truncatum. Squamae e basi sublatiuscula acuminatae v. angustae, obtusae v. acutiusculae, apice \pm barbulatae, atrae v. cinereae, interiores plerumque subdilutius (viridi-) marginatae. Bracteae 1—3 parvae. Pili in involucris caulomatibusque fere semper nulli, rarissime valde solitarii, in caule, in margine nervoque dorsali et in petiolo foliorum modice numerosi v. subdensi (0,5—2 mm), raro parci. Glandulae in involucris caulomatibusque densissimae, raro subnumerosae, in caule \pm profunde descendentes sed valde diminutae. Flocci involucris sparsi v. \pm densi, pedunculi modice v. canofloccosi, deorsum cito diminuti floccosi, caulis superne modice floccosus, deorsum cito effloccosus. Folia caulina superiora in nervo dorsali v. etiam in tota parte aversa parce v. modice floccosa, saepe omnino effloccosa. Flores dilute v. saturate lutei, stylus subater, dentes ligularum \pm ciliati, achaenia pallide v. obscure rubrobrunnea v. obscure brunnea, nunquam atra.

Pyrenaei, Iurassus, Alpes, Sudeti, Tatra, Carpathes, Aprutii, Peninsula Balcanica, Caucasus. — Flor. Iul., Aug.

Numerosae formae intermediae inter *H. prenanthoides* et *H. silvaticum* inventae sunt. Formae intermediae habitu *H. prenanthoidis* speciem intermediam *H. iuranum* Fr. sistunt; formae, quae formulae *prenanthoides* < *silvaticum* respondent, ad speciem intermediam *H. integrifolium* Lange pertinent.

In Hierac. d. Schweiz (1906) p. 462 seq. quinque greges et subspecies numerosae a me distinctae et descriptae sunt. Hoc loco subspecies nonnullae notabiles tantum tractantur.

Subspecies **subperfoliatum** A.-T., Notes pl. Alpes (1884) p. 12; Hier. Alp. franç. p. 92; Zahn, Hier. d. Schw. p. 463; *H. pseudojuranum* var. *subprenanthoides* A.-T. in sched.; *H. elatum* Gren. l. c. p. max. p.; *H. prenanthoides* var. *H. iuranum* Gaud. l. c.; *H. molle* Lagg. in sched. *Aphyllopodium*. Folia caulina numerosa (ad 16) permagna, bis v. ter longiora quam lata, late ovato-lanceolata acuminata, media interdum cito in basin late panduriformem angustata v. basi late ovata v. cordata et auriculata amplexicaulia, superiora cordato-ovata amplexicaulia, omnia tenuia molliorque, subintegerrima, breviter subpilosa (1 mm), supra parcepilosa subglaucescentia, subtus albo-glaucescentia, effloccosa. Involucrum 8—10 mm longum subatrum v. cinereum, epilosum. Squamae subangustae v. angustae, obtusae v. acutiusculae, interiores

saepe distincte diluteque marginatae. Glandulae numerosissimae in caulem profunde descendentes. Achaenia brunnea.

Variat: $\alphagenuinum Zahn [a] *verum* Zahn], Hier. d. Schw. p. 463; *H. praeelatum* A.-T., Soc. franco-helv. (1897) no. 768! Involucro 9 mm longo, squamis subangustis subatris pariter ac pedunculi et caulomata superne densissime obscureque glandulosis; inflorescentia subindeterminata, ramis inferioribus patentibus longis substrictis; foliis 6—8 cm longis, 3—4 cm latis. — Delphinatus, Sabaudia, Pedemontium, Aprutii, Helvetia occidentalis, Iurassus, multis aliorum calcareum locis.$

Exsiccata: Soc. dauph. 5635; Soc. franco-helv. 766; Magnier, Fl. selecta 1995; Porta et Rigo, It. Ital. II no. 30.

Tab. 206. *H. iuranum* Fr. ssp. *subperfoliatum* A.-T. (in iugo Lautaret ad pedem glaciei Tabuchet Delphinatus leg. A. et C. Touton). 1. Squama. 2. Pedunculus sub involucro.

b) *subabruptum* Zahn, Hier. d. Schw. 464, foliis supra caulis medium cito decrescentibus, caule apice tantum ramoso ad 70 cm alto. — Helvetia: Grammont, Dent de Corjeon (Zahn). — Exsiccata: Zahn, Hieracioth. Europ. 288.

β) **tenuiglandulum** Zahn, in Schinz et Kell., Fl. d. Schw. ed. 2 II (1905) p. 329; Hier. d. Schw. p. 464, foliis caulinis brevissime denticulatis tenuibus supra epilosis, involucris ovato-cylindricis saepe 7,5—8 mm tantum longis, squamis angustis obscure cinereis pariter ac pedunculi tenuissime diluteque glandulosis. — Helvetia: in alpinis supra Bex, Ormonts et in tractu calcareo inter Montbovon, Jaun et Bulle.

γ) **asclepioides** A.-T. et Briq., Ann. Jard. bot. Genève (1899) p. 144, foliis \pm tenuibus, supra saturate gramineo-viridibus epilosis v. disperse brevissimeque rigidipilis, subtus glauco- et albedo-viridibus. — Helvetia: Les Plans supra Bex (Wilczek), Klusalp supra Reidenbach vallis Simmental (Zahn), Hohe Rhonen pr. Turicum (Brügger), in silva Brennwald pr. Unterschlecht in pago Glarus (Bernoulli), Val Piora in pago Ticinensi (Huguenin).

Subspecies **pseudoiuranum** A.-T., Hier. Alp. franç. (1888) p. 92. Caulis saepe crassiusculus ad 80 cm altus, inter folia subdense pilosus (1—2 mm), aphyllopodus v. hypophyllopodus, raro florendi tempore basi foliis subnullis virentibus obsitus. Folia caulina 10—18 permagna, 3—5 cm lata, ter v. ad 4,5 longiora quam lata, elliptico- v. oblongo-lanceolata, \pm acuminata acuta, media basin versus conspicue attenuata saepe anguste panduriformia, amplexicaulia, superiora basi lata, rarius subangustata amplexicaulia haud auriculata, omnia breviter dentata v. dentata, utrimque dentibus 3—5 varie magnis munita, effloccosa. Inflorescentia saepe subindeterminata, rami superiores \pm approximati tenues, pedunculi arcuato-squarrosi. Capitula numerosa v. numerosissima, involucrum parvum, 7—8 mm longum, pariter ac caulomata densissime glandulosa.

Variat: α) **genuinum** Zahn, Hier. d. Schw. p. 466; involucris pedunculisque densissime sublongeque glandulosis; foliis dilute lutescenti-viridibus, supra disperse breviterque (0,5 mm) pilosis.

1) normale Zahn l. c.; *H. prenanthoides* I *multiflorum* β) foliis integris Gaud. l. c. p. 113 et herb. l. p.; foliis tantum denticulatis subtus subcano-

viridibus. — Helvetia: Ormonts (A. et C. Touton), Allières (Jaquet); Delphinatus (A.-T.).

2) *sarretoides* A.-T. in sched., Zahn l. c.; foliis omnibus dentatis, inferioribus interdum dentibus maioribus munitis.

a) *verum* Zahn l. c.; nec *H. prenanthopsis* Murr, in Dörfler, Herb. norm. 4355; nec Murr et Zahn, in Koch Syn. (1901) p. 1878; involucri obscure canescenti, glandulis \pm dilutis. — Helvetia, Sabaudia, Iurassus.

b) *atriglandulum* Zahn l. c.; *H. sarretoides* A.-T. in sched. !; involucri atro subeffloccoso, glandulis atris oblecto. — Helvetia: Eginental et Gerental pr. Oberwald, Melchtal pr. Binn (Chenevard, Zahn).

β) *leptadenium* Zahn, in Schinz et Kell., Fl. d. Schw. ed. 2 II (1905) p. 330; Hier. d. Schw. p. 466; foliis obscure viridibus tenuissimis mollissimis, inferioribus magnis longissime petiolatis irregulariter et breviter v. \pm grosse dentatis supra parce pilosis (0,5 mm) v. pilosis et \pm lucidis; involucri pedunculisque densissime sed tenuissime glandulosis. — Helvetia: In alpinis calcareis supra Bex, Ardon, Reidenbach, Wengen; Lötschental, Oberwald; Tavanasa in v. Vorderrheintal, Serneus. Vorarlbergia: in iugo Arlberg.

γ) *constrictiforme* Zahn, Hier. d. Schw. p. 466, characteribus ut in var. β , sed involucri pedunculisque pilis nonnullis obsitis, foliis caulinis superioribus in nervo dorsali subfloccosis. — Helvetia: Wengen, Lötschental (Favrat).

δ) *subaligerum* Zahn l. c., caule usque ad basin longe ramoso, involucri obscure canis. — Helvetia: Bérissal (Bernoulli).

Tab. 207. *H. iuranum* Fr. ssp. *pseudoiuranum* A.-T. α) *genuinum* 1) *normale* Zahn („L'Urquy“ supra pagum Allières inter Montreux et Montbovon, leg. Jaquet). 1. Squama. 2. Pedunculus sub involucri.

Subspecies *prenanthopsis* Murr, in Doerfler, Herb. norm. no. 4355, et apud Zahn in Koch Syn. (1901) p. 1878; nec Zahn, Hierac. d. Schw. (1906) p. 469; *H. pseudoiuranum* α) *genuinum* Zahn 2) *sarretoides* A.-T. a) *verum* Zahn, Hier. d. Schw. p. 466 p. p. — *H. pseudoiurano* A.-T. valde simile; caule hypophyllopo v. aphyllopo ad 15 foliato, foliis omnibus dentatis subrigidiusculis supra plerumque glabrescentibus, inferioribus haud raro dentibus maioribus munitis, summis in nervo dorsali saepe subfloccosis, involucri saepe obscure canis, glandulis plerumque \pm dilutis. — Verosimiliter *lanceolatum* > *silvaticum*.

Helvetia: Bière (Jeanjaquet) et Creux-du-Van (Palézieux) Iurassi; versus Pannossière pr. Fionney (A. et C. Touton), Zermatt (Wolf) Goppisberg supra pag. Mörel (Bernoulli), inter Salquenen et Leukerbad (Wolf), Thyon (Wolf), Bérissal (Favrat), in v. Binn (Chenevard), inter Obergestelen et vallem Eginen (Zahn) Valesiae; Realp (Wolf); in alpin. Lemanensibus (Briquet); Italia sept.: in v. Pesio (Bicknell); Vorarlbergia: „Aelple“ pr. Dornbirn (Hedwig Winder), in iugo Arlberg supra Stuben (Hellweger et Murr), Tirolia: in pratis mont. supra Lechleiten (Murr); in v. Jaufental supra „Schluppess“ (id.).

Exsiccata: Doerfler, Herb. norm. 4355; Zahn, Hierac. d. Schw. Europ. 80.

Tab. 209. *H. iuranum* Fr. ssp. *prenanthopsis* Murr et Z. (e iugo Arlberg, leg. Murr). 1. Squama. 2. Pedunculus sub involucri. 3. Pars aversa cum nervo dorsali folii caulini superioris.

Subspecies **elegantissimum** Zahn, in Koch Syn. (1901) p. 1882; *H. iuranum* var. *coarctatum* f. *badiosperma* A.-T. in sched. herb. Huteriano. Hypophyllopodium v. aphyllopodium. Folia caulina ad 12, ima longe, sequentia breviter petiolata, sat magna, ad 4 cm lata, elliptico- v. oblongo-lanceolata, plerumque valde elongata, rarius breviora ovato-lanceolata, media basin versus angustius latiusve attenuata, amplexicaulia, summa basi lata v. \pm cordata sessilia, subtus \pm dense floccosa, media subtus disperse, inferiora in nervo dorsali modice floccosa, omnia supra subglabra saturate viridia, serrato-pluridentata. Involucrum 8—9 mm longum, squamis angustis sat dense floccosis epilosis. Inflorescentia arcuato-squarrosa, caulomata canofloccosa denseque glandulosa. Caulis superne tantum subfloccosus.

Variat: $\alphagenuinum Zahn, Hier. d. Schw. p. 468 [a] *verum* Zahn], caule superne tantum ramoso. — Helvetia: Allières (Jaquet), Pacoteires supra Alesse (Besse), Oberwald (Zahn), Sils, Samaden (Touton), Puschlav: in alpe Prairolo (Brockmann); Tirolia: in iugo Jaufen pr. Sterzing (Huter).$

b) *valderamosum* Zahn l. c., caule usque ad medium v. usque ad basin ramoso. — Christolais pr. Samaden (Candrian), Jaufen (Huter).

β) **praealpinum** A.-T. in sched.; Zahn, Hier. d. Schw. l. c.; caule phyllopodo foliis radicalibus lanceolatis v. oblongo-lanceolatis, caulinis 6—10 subcito decrescentibus radicalibus similibus, inflorescentia paniculato-oligocephala.

— *Helvetia*: Vallesia, Engadina, in pago Ticinensi; in alpinis *Bavaricis*,

Exsiccata: Doerfler, Herb. norm. no. 4357; Zahn, Hieracioth. Europ. no. 78 et 383 (var. β).

Tab. 208. *H. iuranum* Fr. ssp. *elegantissimum* Zahn α) **genuinum** a) *verum* Zahn (in valle Jaufental pr. [Vipitenum] Sterzing, leg. J. Murr). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies **pseudohemiplecum** Zahn, in Koch Syn. (1901) p. 1883, Hierac. d. Schw. (1906) p. 468. — Hypophyllopodium v. phyllopodium, foliis caulinis 5—9, inferioribus praegrandibus \pm alato-petiolatis, reliquis subcito decrescentibus, mediis \pm petiolatis v. basin versus angustatis subpetiolatis et subamplexicaulibus haud auritis, superioribus basi lata sessili semiamplexicauli, omnibus dentatis v. serrato- et saepe grosse dentatis, glaucescenti- et saturate viridibus, submollibus v. subrigidiusculis saepe papyraceis, radicalibus abrupte in petiolum longum plerumque haud alatum contractis.

Variat: α) **vaudense** Zahn, in Koch Syn. p. 1883; *H. iuranum* Fr. p. p., quoad stationem „Trachy supra Bex“ in Epierisis p. 104 commemoratam; *H. iuranum* et *cydoniaefolium* Lager in sched.; foliis inferioribus ovato-oblongis (11:5,5 cm), basi truncatis v. breviter contractis, caulinis ad 9 cito in partem basalem quasi latissime alatum angustatis, superioribus basi lata sessili vix subamplexicaulibus, omnibus magnis tenuibus grosse dentatis supra glabris; involucris ovato-cylindricis parvis.

1) normale Zahn, Hier. d. Schw. l. c. — Helvetia: Trachy supra Bex (Lager); Col de la Croix et Léchères in Ormonts (A. et C. Touton).

2) floccosum Zahn l. c., involucris pedunculisque densissime floccosis. — Col de la Croix (Favrat).

β) **ramosofastigiatum** A.-T. apud Zahn, in Koch Syn. (1901) p. 1883; caule usque ad basin ramoso, hypophyllopodo, ramis \pm erectis; foliis caulinis magnis grosse dentatis supra disperse pilosis (0,5 mm), imis subsensim in

petiolum angustatis. — Helvetia: Taney (Zahn), Fionney (A. et C. Touton) Varvalannaz et Bois de Minutz sur le Gros-Mont 1600 m (Jaquet); Reidenbach in v. Simmental (Maurer); Weisstannental (Kaeser). Tirolia: Ahrntal (Treffer). — Forma foliis denticulatis in iugo Sareiser Joch Vorarlbergiae (Zahn).

Tab. 210. *H. iuranum* Fr. ssp. *pseudohemiplecum* β *vaudense* Zahn (in valle Gryonnental supra Frenières legi). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies **decresecentifolium** Murr, apud Zahn, in Hierac. d. Schw. (1906) p. 469. Phyllopodum v. hypophyllopodum; foliis radicalibus v. imis caulinis praegrandibus, sequentibus \pm cito decresecentibus basi angustata sessili vix subamplexicauli, caulinis 4—6 tantum evolutis \pm grosse dentatis. Reliqua ut in ssp. *pseudohemipleco*.

Helvetia: Pacoteires supra Alesse, Ardon 1400 m (Besse), Pont de Nant 1400 m (Bernoulli). — Tirolia: In v. Jaufental: ad septentriones viculi Schluppes (Murr).

Tab. 211. *H. iuranum* Fr. ssp. *decresecentifolium* Murr (e v. Jaufen leg. Murr). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies **adenocalathium** Zahn, in Koch Syn. (1901) p. 1876; Hier. d. Schw. (1906) p. 474. Caulis 30—50 cm altus gracilis flexuosus sat dense pilosus (2 mm), hypophyllopodus, 4—12 (—18)-cephalus, aeladio ad 20 mm longo, ramis 2—3 (—4) tantum evolutis subremotis 1—2-pliciter ramulosis. Folia caulina 6—8 (—10), elliptico- v. oblongo-lanceolata, ima petiolata v. in basin late alatum subpetioliformem cito angustata, sequentia basi subpanduriformi, summa basi lata sessilia, omnia subamplexicaulia mollia, utrinque subdense molliterque pilosa, supra dilute lutescenti-viridia, subtus albido-viridia, denticulata v. dentata. Inflorescentia laxa paniculato-squarrosa. Involucrum 10—11 mm longum, squamis latis obtusis atris modice v. subdense floccosis epilis. Achaenia dilute rubro-brunnea.

Helvetia: Vingt-huit inter Gétroz et alpem Chanrion vallis Bagne (Wolf), Sandalp pr. Glarus (Thellung), in v. Sertig pr. Davos 1950 m (Zahn).

Tab. 212. *H. iuranum* Fr. ssp. *adenocalathium* Zahn (in v. Sertig legi). 1. Dentes ligularum. 2. Squama. 3. Pedunculus sub involucrio.

Subspecies **pseudalbinum** Uechtr., Result. Durchforsch. Schles., in Jahresb. Schles. Ges. (1884) p. 314; G. Schneid., Hierac. Westsudet. in „Das Riesengebirge in Wort u. Bild“ Heft 44 et 46 (1892) p. 67; Zahn, in Koch Syn. (1901) p. 1879 inter subspecies *H. iurani*. — Caulis (20—) 25—30 (—50) cm altus gracilis v. tenuis flexuosus vix striatus subglaber v. scabriusculus, basi rubro-coloratus v. pariter ac foliorum inferiorum petioli rubro-maculatus, in inferiore tertia parte tantum sparsim mediocriterve pilosus (1,5—2 mm), superne glandulis tenuibus sparsis v. mediocriter numerosis et interdum floccis dispersis obsitus. Folia dilute, subtus pallide viridia, siccitate saepe sublutescentia, subrigida, mediocriter, margine basin versus et praecipue in nervo dorsali petioleque \pm densius pilosa, pilis mollibus 0,5—1 mm, in petiolis ad 2 mm longis; omnia florendi tempore oblique erecta; radicalia interdum omnia emarcida, saepius 1—2 (—6) virentia elliptica v. oblonga, in petiolum tenuem obsolete v. haud alatum plerumque sublongum \pm angustata, subregulariter remoteque denticulata, obtusiuscula, brunnescenti-mucronulata; caulina (3—) 4—6 (—8) sensim decresecentia, imum semper minus quam radicalia, pariter ac saepe secundum oblongum v. late lanceolatum, in petiolum \pm longum distincte alatum angustatum, subaequaliter denticulatum acutum mucronatum; media late lanceolata in petiolum brevem alatum basi semiamplexicaulem angustata, basin

versus subdentata, subacuminata mucronata; summa ovato-lanceolata basi vix semiamplexicaulia longius acuminata acuta, denticulata v. integerrima. Inflorescentia subdeterminata paniculata 3—8 (—15) cephalis, acladio 10—15 mm longo, ramis 2—4 (—6) parum remotis. Involucrum (9—) 10 (—11) mm longum subcylindrico-ovatum epilosum dense glandulosum subfloccosum, squamis angustis obtusis v. nonnullis acutiusculis, apice subbarbulatis, exterioribus subatris partim laxis ± anguste viridi-marginatis, interioribus subviridibus dorso obscurioribus margine pallidis. Bracteae 1—2 subobscurae parvae. Pedunculi subgraciles arcuato-erecti epilosi dense glandulosi apice modice v. dense-, deorsum subfloccosi. Ligulae aureolatae apice breviter ciliatae, stylus obscurus; achaenia rubro-, denique atrobrunnea.

In montibus Asciburgensibus [Riesengebirge] Silesiae endemum: Kiesberg 1300 m, in devexis infra m. Kleine Koppe, Riesengrund (Pax), Grosse Schneegrube, Langer Grund (Fiek), Melzergrund (id.).

Involucrum 8—10 mm longum ovatum v. ovato-cylindricum, squamis atris v. atro-viridibus subangustis v. angustis, modice v. subdense floccosis, dense glandulosis, saepissime

¹⁾ *H. vulgatum* var. *integrifolium* Fr. Symb. p. 117 complectit: 1) *H. vulgati* formam (cfr. Fries, Herb. norm. XII no. 23), 2) plantam *Langeanam* a Friesio p. 118 citatam. Prima forma: *H. silvaticum* ssp. *integrifolium* Alm., Stud. Hierac. p. XVII, a cl. Dahstedt (in Stenstr., Verml. Archierac. 1889 et in Dahlst., Bidr. Sydöst. Sver. Hierac.-Fl. II 1893 p. 118) *H. integratum*, secunda *Langeana* *H. danicum* l. c. p. 120 denominata erat. Sed nomen Langei, qui plantam suam bene descripsit et figuravit, conservare velim, quoniam Friesius l. c. et Froelichius in DC., Prodr. VII p. 214, varietates tantum *H. vulgati* seu *H. humili* nomine „*integrifolium*“ notaverint.

epilosis, interioribus + dilute marginatis. Pedunculi consimiles, + cani, 2—3 bracteis parvis obsiti. Flores plerumque saturate lutei, ligulis apice plerumque ciliatis, stylis obscuris; achaenia rubrobrunnea v. castanea, nunquam peratra. — Iul., Aug.

In Iurasso et in toto Alpium tractu Italiae, Galliae, Helvetiae, Austriae, Bavariae, in montibus Sudeticis et in Carpathium tractu; qsp. in Dania. — Pyrenaei.

Subspecies **crepidifolium** A.-T., Hierac. Alp. franç. (1888) p. 89. — Habitu *Crepidis paludosae*. Folia radicalia ovato-lanceolata v. oblongo-lanceolata, longe petiolata, cito sensimve in petiolum angustata, obtusa v. acuta; caulina 2—5, imum petiolatum v. in basin + late alatum v. subpanduriformem basi semiamplexicaulem angustatum, media basi aurita v. pariter ac superiora simpliciter sessilia subamplexicaulia, omnia + vel saepe grosse serrato-multidentata, dilute lutescenti-viridia, subtus albido-viridia, supra + modice, in margine nervoque dorsali et in petiolo dense pilosa (1—2,5 mm). Stylus subater. Involucra 9—10 mm longa.

α) **crepidifolium** A.-T.; ut supra.

- 1) subellipticum A.-T., Ann. Jard. bot. Genève (1901) p. 163; Zahn, Hier. d. Schw. (1906) p. 477; foliis rosularibus ellipticis vix grosse dentatis, caulinis in petiolum brevem late alatum basi semiamplexicaulem angustatis, irregulariter serrato-dentatis, summis sessilibus subamplexicaulibus. — In alpinis Lemanensibus: Pte de Lachau, Crête de Hautfleury (Briquet); Helvetia: in v. Sertig pr. Davos (Zahn).
- 2) axillare A.-T. in sched.; Zahn, in Schinz et Kell., Fl. d. Schw. ed. 2 II (1905) p. 332; caule iam e basi ramoso. — Helvetia: Pont de Nant (Chenevard), Col de Lens supra Saxon (id.).
- 3) sinuososerratum Zahn, Hierac. d. Schw. p. 477; foliis rosularibus submagnis oblongis longe petiolatis in petiolum abrupte (intimis magis sensim) angustatis, caulinis 4—5, inferioribus petiolatis, reliquis in basin subpetioliformem angustatis v. basi angustata sessilibus et subamplexicaulibus, omnibus grosse v. grossissime sinuato-dentatis, dentibus magnis apice glanduliformibus, aliis parvis in sinibus alternantibus. — Helvetia: Pacoteires (Besse), Les Plans (Wilczek), Zermatt, Niouc (Wolf).
- 4) crepidellum A.-T., apud Zahn in Schinz et Kell. l. c.; foliis radicalibus exterioribus + cordato-ovatis, inflorescentia + silvaticiformi. — Helvetia: Alesse (Muret), Simplon (Favrat), Binn (Chenevard), Oberwald (Zahn).

β) **crepidopsis** Zahn, Hier. d. Schw. (1906) p. 477; *H. crepidifolium* A.-T. in sched. p. p.; foliis irregulariter glanduloso- et serrato-dentatis, rigidioribus, saturate viridibus subglaucescentibus, supra sparsissime pilosis; capitulis parum numerosis (5—15); stylo subdiluto. — Tirolia: Luttach (Treffer). — Meo sensu propria subspecies.

Exsiccata: Doerfler, Herb. norm. 3120.

Tab. 214, Fig. B. 3. *H. integrifolium* Lange ssp. *crepidifolium* A.-T. β) *crepidopsis* Zahn (leg. Treffer). 3. Squama.

Subspecies **oleicolor** Zahn, Hier. d. Schw. (1906) p. 480; *H. pseudomurorum* Treffer in sched. — Variationi *crepidopsis* subspeciei *crepidifoliae* A.-T. valde simile. Ubique breviter tantum pilosum. Folia olivaceo- v. saturate viridia, late lanceolata v. angustiora, submollia v. rigida, breviter dentata v. irregulariter serrato-multidentata haud ita magna, supra + glabra lucidaque, subtus glaucescenti-albo-viridia; caulina 2—3 (—4). Reliqua ut in ssp. *integrifolia*.

Helvetia: Inter Sils et iugum Maloja (A. et C. Touton), Parpan (id.); in m. Alvier

(Murr): Vorarlbergia: in iugo Arlberg (Murr); Tirolia: supra Schluppes in v. Jaufental (Huter), Luttach (Treffer).

Tab. 214, Fig. A 1, 2. *H. integrifolium* Lange ssp. *oleicolor* Zahn (in v. Jaufental, leg. (Murr). 1. Squama. 2. Pedunculus sub involucrio.

Subspeciei *crepidifolii* variatio *crepidopsis* pariter ac ssp. *oleicolor* formulae *lanceolatum* < *silvaticum*, ut opinor, respondent.

Subspecies *integrifolium* Lange l. c.; *H. subalpinum* A.-T. l. c.; *H. diaphanum* Ravaut, Soc. dauph. no. 850. Caulis 30—70 cm altus. Folia rosularia 3—6 longe petiolata saepe permagna, ovata v. oblongo-lanceolata, abrupte in petiolum contracta v. \pm truncata, sed semper paulum in petiolum decurrentia v. \pm sensim angustata, plerumque acuminata, leviter denticulata v. dentata, dilute v. saturate viridia, subtus glaucescenti-viridia, saepe tenuia v. papyracea; caulina 2—4 remota saepe permagna radicalibus similia v. haud raro cito decrescentia, inferiora in petiolum late alatum basi sublatiorem subamplexicaulemque contracta, superiora sessilia subamplexicaulia obsolete v. subgrosse dentata. Inflorescentia laxissime squarrosa, ramis oblique v. erecto-patentibus, oligo- v. pleiocephala, saepe indeterminata. Involucrum (8—) 9—10 mm longum ovatum v. ovato-cylindricum, squamis \pm angustis obtusis v. (intimis) acutiusculis, epilosis, dense glandulosis. Achaenia rubro-brunnea v. brunneo-atra.

Variat: α) *genuinum* Zahn, in Koch Syn. p. 1883; Hierac. d. Schw. p. 479; caule inferne dense piloso, foliis utrinque modice v. subdense, in petiolo \pm dense pilosis (0,5—1,5 mm). Glandulae densissimae.

1) normale Zahn, Hierac. d. Schw. l. c.; foliis permagnis.

a) *verum* Zahn l. c., foliis omnibus permagnis leviter tantum denticulatis. — Dania (Lange!). — Helvetia: Creux-du-Van (Muret), Tête-plumée au Grd-Soleil (Jeanjaquet) in Iurasso; Pont de Nant (Wilczek), Col de la Croix, inter Orsières et Bourg-St.-Pierre (A. et C. Touton) Exsiccata: Dörfler, Herb. norm. 3123 (e Dania)!

Inter plantam Danicam (Langeanam) et Helveticam nulla differentia exstat.

b) *subalpinum* A.-T., foliis minus magnis, caulinis subcitius decrescentibus, inflorescentia \pm indeterminata, ramis inferioribus elongatis. — Per Alpium tractum haud rarum, sed praecipue in Delphinatu et in Helvetia australi-occidentali pervulgatum.

c) *calvescens* Zahn, in Schinz et Kell., Fl. Schw. ed. 2 II (1905) p. 335; foliis supra glabrescentibus. — Cum forma praecedenti.

d) *dentatum* Zahn, Hierac. d. Schw. p. 479, foliis breviter glanduloso- v. (praesertim caulinis) \pm grosse serrato-dentatis, magnis. — Helvetia: Inter Frenières et Solalex (Zahn), L'Aisy supra Châtel-sur-Montsalvens (Jaquet) etc.

e) *alpestre* A.-T. in sched. apud Zahn l. c., foliis radicalibus minus magnis, caulinis cito decrescentibus, omnibus saepe \pm rigidis et haud raro purpureo-coloratis (f. *purpureum* A.-T., Monogr. p. 24). — Grd-St.-Bernhard: Les Combes (Wilczek), in alpib. supra Bex (Muret), in valle Binn (Chenevard), Samnaun Rhaetiae (Kaeser) etc.

- f) *maculatum* Zahn l. c. p. 480. — Foliis supra submaculatis. — Inter Fionney et Pannossière Valesiae (A. et C. Touton).
- g) *submurorum* Zahn l. c., foliis rosularibus truncatis v. exterioribus \pm cordatis. — Helvetia: Simplon (Besse), Klusalpe pr. Reidenbach in v. Simmental (Maurer); Parpan et Engadina superior (A. et C. Touton)
- 2) *papyraceum* A.-T., Hier. Alp. franç. p. 88; nec Sch.-Bip.; foliis tenuibus sed papyraceis dilute viridibus subtus \pm glaucescenti- et albido-viridibus, \pm sparsim brevissimeque pilosis; involucris minoribus, squamis angustis, pedunculis plerumque tenuissimis, glandulis tenuioribus.
- a) *normale* Zahn, foliis tantum denticulatis, rosularibus plerumque minus numerosis longe tenuiterque petiolatis. — Helvetia austro-occidentalis.
- b) *ellipticum* A.-T. l. c.; *H. ellipticum* Jord., Cat. gr. jard. Dij. 1848 p. 21 apud A.-T.; foliis caulinis saepe magnis ellipticis v. ovatis saepe \pm grosse dentatis. — Iurassus, Helvetia austro-occidentalis.
- c) *attenuatum* Zahn l. c., foliis omnibus utrimque aequaliter angustatis oblongo-lanceolatis. — Helvetia: in silvis pr. Lens (Besse).
- d) *dentatum* Zahn l. c., foliis minoribus, sed \pm grosse dentatis. — Helvetia austro-occid. et austr.: Dalpe (Chenevard).
- e) *ramosum* A.-T. l. c., caule iam e basi ramoso. — Valesia: Lavey (Chenevard) etc.

Tab. 215. *H. integrifolium* Lange ssp. *integrifolium* α) *genuinum* 1) *normale* a) *verum* Zahn (inter Orsières et Bourg St.-Pierre Valesiae leg. A. et C. Touton). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies **moravicum** Freyn in litt. ad Uechtr. 1883; Oborny, Fl. Mähr. p. 590; Zahn, in Koch Syn. (1901) p. 1884; *H. integrifolium* Lange var. *alpestre* Uechtr., Result. Durchf. schles. Planerog.-Fl. (Jahresber. schles. Ges. 1884 p. 10). — Subspeciei *integrifolio* Lange valde simile. Folia rosularia 2–5, exteriora parva saepissime emarcida, reliqua late ovata v. ovato-oblonga et oblongo-lanceolata, obtusiuscula v. subacuta, caulina 2–3 (—5), inferius in petiolum longum angustatum ovato-lanceolatum acuminatum, media basi angustata sessilia vix subamplexicaulia, summa lanceolata vel \pm bracteiformia; omnia disperse breviterque pilosa denticulata v. subdentata. Involucra obscure canescenti-viridia v. atra, pariter ac pedunculi dense sat longeque glandulosa et semper pilis nonnullis obscuris adpersa. Capitula 4–12. Achaenia rubrobrunnea.

In Sudetis: Grosser Kessel, Mentschikgraben (Freyn), Schlösselgraben copiose, Franzens-Jagdhaus, Petersteine, Altvater, Hockschar (Ficinus, Bubela, Oborny), Johannishütte, Fuhrmannsteine, Brünnelhaide, Hirschbrunnen, Maiberg, Kleiner Kessel, Schwarze Koppe pr. Kl.-Mohrau, Alfredshütte pr. Altendorf, Wilder Steingraben pr. Winkelsdorf; usque ad 800 m descendens (Oborny, Hierac. Mähr. österr. Schles., in Verh. nat. Ver. Brünn XLIII et XLIV 1905 p. 183).

Tab. 216. *H. integrifolium* Lange ssp. *moravicum* Freyn (in m. Brünnelhaide montium „Gesenke“ leg. A. Oborny). 1. Dentes ligularum. 2. Squama. 3. Pedunculus sub involucrio. Subspecies **albinum** Fr., Epicr. (1862) p. 103; Fiek, Fl. Schles. (1881) p. 272; Zahn,

in Koch Syn. (1901) p. 1879; *H. atratum* Fr., Symb. (1850) p. 105 p. p.; *H. prenanthoides* Vill. a) *sparsifolium* Tsch. in Flora (1828) Erg.-Bl. I p. 74. Caulis (22—) 30—35 (—50) cm altus gracilis v. subcrassiusculus, superne subflexuosus, basi rubescens sursum viridis, ± distincte striatus, infra medium mediocriter v. subdense pilosus, superne epilosus et sparsim mediocriterve floccosus, simul modice sparsimve glandulosus v. subglabratus. Folia gramineo-viridia ± tenuia (praesertim in umbrosis), subtus pallidiora, subdense, in margine densius pilosa (0,5—1 mm), pedunculis subvillosulis; radicalia 2—4 rarius compluria florendi tempore virentia, oblongo-ovata, infra medium v. in inferiore tertia parte latissima, plerumque in petiolum mediocriter longum anguste alatum abrupte contracta, basin versus sinuato-dentata v. denticulata, obtusa v. obtusiuscula; caulina (2—) 3 (—4), inum (in caule 4-foliato etiam secundum) radicalibus simile sed plerumque maius, proximum in inferiore tertia parte, rarius iam infra medium abrupte in basin late alatum subpetioliformem basi semiamplexicaulem contractum, apice acutiusculum, rarius obtusiusculum; summum ovatum parum amplexicaule vel sessile, plerumque ± acuminatum. Capitula (2—) 3—5 (—10), acladium 10—20 mm longum, rami primarii (1—) 2—3 (—4) subremoti arcuato-erecti, ordines axium 3 (—4). Involucrum 10 (—11) mm longum ovatum epilosum dense glandulosum plerumque subfloccosum, squamis subangustis v. sublatiusculis subatris, exterioribus obtusiusculis v. acutiusculis, interioribus ± acutis viridi-submarginatis, intimis late viridi-marginatis. Pedunculi graciles dense glandulosi epilosi, praesertim superne modice floccosi. Flores aureo-lutei, ligulae apice breviter subciliatae, stylus obscurus, achaenia rubro-brunnea.

In montibus Asciburgensibus (Riesengebirge) endemum: Grosse et Kleine Schneegrube 1250—1300 m, Elbgrund (Pax), Kleiner Teich, etiam forma *stylosa* (Pax), Langer Grund (Fiek), Melzergrund, Kleine Koppe (G. Schneider), Kesselkoppe, Kiesberg (Fiek), Krkonoš (Freyn). — (800—) 1000—1350 m.

Tab. 217, Fig. A. 1, 2. *H. integrifolium* Lange ssp. *albinum* Fr. (in m. Grosse Schneekoppe 1260—1290 m solo granitico leg. G. Fiek). 1. Squama. 2. Pedunculus sub involucri.

Subspecies **exilentum** Arv.-Touv., Hierac. Alp. franç. (1888) p. 90; Zahn, in Koch Syn. (1901) p. 1881; Hierac. d. Schw. (1906) p. 480; *H. subalpinum* var. *exilentum* A.-T. in sched. — *H. silvatico* proximum. Folia radicalia 2—4 subparva oblongo-lanceolata v. lanceolata v. ± ovata, acuta v. obtusa, ± longe petiolata, praesertim basin versus saepe grosse dentata; caulina 2 (—3) remota, citissime decrescentia, basin versus angustata parum amplexicaulia, haud raro subtus ± floccosa, plerumque grosse dentata. Capitula plerumque pauca parva, 8—9 mm longa, epilosa v. pilis solitariis obsita, modice floccosa, sat dense glandulosa. Pedunculi consimiles, cani.

Variat: α) **exilentifforme** Zahn, in Schinz et Kell., Fl. d. Schweiz (1905) p. 331; Hierac. d. Schw. p. 481; foliis lutescenti-viridibus subtus effloccosis, denticulatis v. breviter dentatis. — Helvetia: Grd St.-Bernhard, Arpille (Besse), Simplon (Favrat). — Delphinatus. — Exsicc.: Soc. franco-helv. no. 751 (false „*brunelliforme*“ denominatum).

Caulis 10—35 cm altus saepe subflexuosus, crassiusculus v. gracilis, raro crassus, 1—4 cephalus, sursum pilis 4—5 mm longis obscurioribus, basi incrassatis nigris, deorsum basin versus dilutis, apice setis nigris glandulisque immixtis ± dense vestitus et sat dense, deorsum subfloccosus. Folia subglaucescentia, utrimque ± dense pilosa (2 mm) disperseque glandulosa; radicalia florendi tempore emarcida v. pauca, fere semper tantum in rosulis secundariis virentia; caulina 3—6 sensim decrescentia, inferiora oblongo-lanceolata, in petiolum brevem angustata, reliqua lanceolata basi subangustata sessilia, omnia obtusa v. acuta, integerrima vel subdenticulata rarius subdentata, oblique distantia. Inflorescentia furcata, ramis primariis valde remotis monocephalis. Involucra globosa v. subventricosa denique saepe subtruncata, 12—17 mm longa, dense villosa, pilis ad 3 mm longis obscuris apice dilutis, sparsim glandulosa, disperse v. modice floccosa, squamis multiseriatis vix unquam foliaceis, latiusculis acutiusculis, nigrescentibus, intimis vulgo dilutioribus. Pedunculi crassiusculi, pilis ad 6 mm longis nigrescentibus, setisque nigris et glandulis subnumerosis praediti, apice dense floccosi. Flores aureo-lutei, ligulis apice breviter ± ciliatis, stylo aureo-luteo, rarius obscuriore.

Variet: 1) normale G. Schneid. l. c., ligulis evolutis.

- a) *verum*, stylo luteo. — In montibus Asciburgensibus: Koppenplan, Auparand, Weisse Wiese, Melzerlehne, Kleine Sturmhaube, supra Grosser et Kleiner Teich, Kleine Koppe, ad fl. Lomnitz supra Melzergrund, Schlingelbaude. (800—) 1000—1420 m (Sagorski, G. Schneider).
 - b) *obscuristylum*, stylo obscuriore. — In Sudetis orientalibus: Glatzer Schneeberg (Oborny), Dürre Koppe (Formanek). — Tatra: Kriván, Grosses et Kleines Kohlbachtal, Késmarker Gruensee, Zamki et Schwarzwierch (Rehmann). — Retyezát in com. Hunyad Hungariae (Czako).
- 2) *macrostylon* Tausch, in Flora 1837, Erg. B. p. 68; *stylosum* G. Schneid. l. c.; stylo ex tubo longe exserto. — Kleine Koppe 1000—1350 m, Auparand, Koppenplan, Kiesberg, Melzerlehne, Kleiner Teich, Rehhorn (G. Schneid., Pax). — Késmarker Gruensee (Sagorski).

Tab. 239, Fig. B, 4. *H. Fritzei* F. Sch. ssp. *pseudopersonatum* G. Schneid. 2) *macrostylon* Tausch (prope Spindlerbaude leg. A. Schultz). 4. Squama.

132. Hieracium riphaeum Uechtr., Österr. bot. Zeitschr. 1872 p. 41; Fiek, Fl. Schles. 1881 p. 282; = **prenanthoides** > **alpinum** Zahn, in Koch Syn. 1901 p. 1888.

Caulis (15—) 20—30 (—40) cm altus, subgracilis vel tenuis, indistincte vel haud striatus, supra basin haud raro rubescens, scabriusculus, disperse, basin versus densius pilosus 1—2 mm), pilis basi atris obscurisve, caulis basin versus tantum omnino dilutis, superne sparsim floccosus, deorsum cito effloccosus, praecipue apice sparsim glandulosus vel subeglandulosus, aphyllopodus, raro per rosulas sessiles perhiemans. Folia radicalia spathulato-lanceolata in petiolum latum angustata, subdense pilosa, in margine sparsissime glandulosa, florendi tempore fere semper emarcida; caulina (4—) 5—6 (—8) sensim decrescentia subrigida v. mollia, intense viridia, subtus subpallidiora vix vel indistincte reticulato-venosa, subglaucescentia, utrimque modice, in margine densius pilosa (0,5—1 mm, in margine 1—1,5 mm)

et sparsissime glandulosa, saepe truncis pilis scabra, subremota; ima (florendi tempore plerumque emarcida) subspathulata in petiolum late alatum semiamplexicaulem angustata, rarissime attenuata subpanduriformia, remote et obsolete denticulata, obtusiuscula v. acutiuscula; media oblongo- v. interdum sublate lanceolata basi rotundata, superiora obovato-lanceolata, basi truncata semiamplexicaulia, media superioraque sensim acuminata, summa in nervo dorsali v. interdum in tota parte aversa disperse floccosa, v. effloccosa, omnia oblique distantia basi nunquam cordata, media superioraque obsolete denticulata, dentibus subappropinquantis glanduliformibus, raro repando- vel sinuato-dentata et dentibus apice longe glanduliformibus munita. Inflorescentia plerumque determinata rarius indeterminata, laxe paniculata subsuprafastigiata; rami primarii 1—4 (rarissime —10), superiores conferti, inferiores (interdum valde) remoti; ordines axium 2—3 (—4); capitula (1—) 2—4 (rarissime —15); aeladium (5—) 10 mm longum. Involucrum 10—11 (—12) mm longum ovatum vel semiglobosum, basi denique subtruncatum, pilis c. 2 mm longis canescentibus basi atris glandulisque brevibus atris modice v. ± dense vestitum. Squamae latiusculae obtusiusculae v. obtusae obscurae, sparsim, in margine et praecipue basin versus submodice floccosae, interiores sordide atro-virides, in dorso subatrae. Bracteae 1—3 subulatae. Pedunculi ramique pilis canescentibus basi atris glandulisque subnumerosis obsiti, superne subcanofloccosi, floccis usque ad caulis medium descenditibus sed deorsum valde deminutis. Flores aureolutei plerumque haud lingulati, sed abbreviati tubulosi apice in dentes longos sparsim ciliatos vel subglabros lacerati, stylis obscuris longe exsertis. Achaenia initio rubro-, denique atrobrunnea v. atra.

In montibus Asciburgensibus Sudetorum endemum: Kiesberg 1240 m, Auparand, Brunnberg, Wörllichgraben, Schneeegraben (Fiek), Blaugrund (Junger), Langer Grund, Ziegenrücken, Melzergrund (Zimmermann), Kesselkoppe (Frey), Krkonoš (G. Schneider), Weisse Wiese, Kleiner Teich (Sagorski, Oborny).

Exsiccata: Fl. Austro-Hungarica no. 3385.

Tab. 240. *H. riphaeum* Uechtr. (in monte Kiesberg leg. Fiek). 1. Squama. 2. Pedunculus sub involuero. 3. Flos. 4. Margo foliorum. 5. Nervus dorsalis folii caulini superioris.

Subspecies **pseudostygium** Woł., Przyczynek do flory Pokucia (in Sprawozdań Komisyi fizyograficznej Akademii Umiejętności, tom. XXI 1887 p. 128). — Caulis solidus ad 40 cm altus \pm flexuosus gracilis, basi purpurascens, breviter pilosus v. glabrescens, usque ad basin deminute floccosus, rubescenti-maculatus. Folia obscure viridia saepe subglaucescentia, firma, utrimque et praecipue in margine nervoque dorsali pilis albidis sparsis obsita, supra glabrescentia, ad basin dentibus glanduloso-terminatis paucis remotis acutis instructa, oblonga v. oblongo-lanceolata, in basin villosulam contracta; radicalia compluria, florendi tempore plerumque partim emarcida c. 2 virentia ad 12:3,3 cm longa, utrimque aequaliter attenuata, petiolata, acuminata acuta, denticulata v. basin versus 2—3 dentibus grossis munita; caulina 4—5, imum petiolatum, sequentia subpetiolato-angustata basi parum amplexicaulia, sursum brevius angustata basi distinctius semiamplexicaulia, summa lineari-lanceolata v. linearia basi angustata semiamplexicaulia. Inflorescentia laxe paniculata, acladium c. 20 mm longum, rami primarii 3 (—4) remoti oblique patentes, superiores \pm erecti \pm anguineoflexuosi superne subincrassati 3-bracteati fere semper monocephali subdense glandulosi disperse diluteque pilosi dense floccosi, capitula 3—4 (—6). Involucrum terminale ad 15—16 mm longum (c. 30 mm latum) ventricosum, lateralia 12—13 mm longa ovato-globosa, squamis latiusculis acuminatis acutiusculis v. acutis modice v. subdense subobscuraeque brevipilosis, submodice glandulosis vix floccosis, exterioribus obtusiusculis nigricantibus, interioribus pallidioribus viridi-marginatis. Flores saturate aureolutei, ligulis apice subciliatis, stylis obscuris. Achaenia obscure brunnea.

Carpathes orientales: In reg. Mughii montis Sywula sat copiose (Wołoszczak).

Subspecies **pseudeximium** G. Schneid., Österr. bot. Zeitschr. 1887 p. 277 et in „Das Riesengebirge in Wort und Bild“ Heft 41 et 42 (1891) p. 25; *H. decipiens* > *bohemicum* G. Schneid. l. c. — Caulis (15—) 25—30 (—35) cm altus flexuosus crassiusculus v. gracilis striatus, apice et basin versus modice v. subdense, medio disperse v. mediocriter pilosus vel subglaber, pilis 2—2,5 mm longis obscuris deorsum dilutis, apice setis nigris glandulisque subnumerosis immixtis praeditus, praeterea canotomentosus v. densissime floccosus, deorsum deminute floccosus glandulosusque. Folia viridia subrigida, interdum leviter glaucescentia, utrimque dense rarius modice pilosa, vel subglabra et in margine semper subglandulosociliata, pilis in parte superiore 1 mm longis, in margine et in petiolo dense piloso longioribus; radicalia florendi tempore 2—6 ovata v. late lanceolata, petiolis brevioribus v. aequilongis v. paulo longioribus, in petiolum sensim angustata, \pm longe v. breviter acuminata, raro obtusiuscula mucronata, \pm remote sinuato- v. inciso dentata, dentibus apice glandula petiolata v. sessili munitis, rarius serrato-dentata, dentibus magnis saepe in petiolum descendibus minoribus immixtis; caulina (2—) 3—4 (—6) sensim, supra medium abrupte decrescentia, oblonga v. late lanceolata, ima radicalibus similia, in petiolum alatum angustata, reliqua basi angustata subpetioliformia v. breviter alato-subpetiolata subsessilia; omnia \pm grosse dentata, superiora tantum denticulata vel integerrima, omnia acuta v. longe acuminata acutissima. Inflorescentia alte furcata v. laxe paniculata, acladium 1—5 cm longum, rami primarii 0—2 (—4) valde suprafastigiati. Involucrum (15—) 16—17 (—18) mm longum semiglobosum denique saepissime truncatum, dense pilosum subglandulosum, pilis 2 mm longis canescentibus basi atris, sparsim basi subdensius floccosum. Squamae subangustae acutae atrovirides, interiores saepe dilutiores v. dilutius marginatae. Pedunculi cani, pilis sub-

densis obscuris setis nigris immixtis et glandulis subnumerosis obsiti 2—3 bracteati. Flores saturate lutei, ligulis apice brevissime ciliatis, stylis fuliginosis. Achaenia brunneo-atra.

In montibus Asciburgensibus c. 1400 m haud frequens: Supra lacus Grosser et Kleiner Teich, in declivitatibus sub m. Kleine Koppe, in pratis ad fl. Kleine Lomnitz supra Melzergrund, in m. Ziegenrücken (G. Schneider).

Tab. 241, Fig. B. 3, 4. *H. nigrum* Uechtr. ssp. *pseudeximium* G. Schneid. (in m. Kleine Koppe leg. G. Schneider). 3. Squama. 4. Pedunculus sub involucre.

134. Hieracium corconticum K. Knaf fil., apud Čelak., Österr. bot. Zeitschr. 1883 p. 79: **prenanthoides** > (**alpinum—silvaticum**) Zahn, in Koch Syn. 1901 p. 1890; *H. juranum* G. Schneid., in „Das Riesengebirge in Wort und Bild“, Heft 47 et 48 (1893) p. 21. — Flor. Julio—Aug.

Subspecies **corconticum** K. Knaf. — Caulis (10—) 25—30 (—60) cm altus subtenuis v. *gracilis* flexuosus striatus scabriusculus, basi plerumque brunneo-rubescens v. inferne brunneo-rubro-maculatus, v. inferne subdense, superne minus pilosus v. glabratus, pilis dilutis ad 2 mm longis infra inflorescentiam tantum setis solitariis brevibus atris, glandulis nonnullis floccisque dispersis deorsum cito evanidis obsitus, phyllopodus v. hypophyllopodus. Folia dilute rarius obscure viridia ± glaucescentia, subtus pallidiora vix reticulato-venosa, denique saepe lutescentia, in margine sparissime glanduloso nervoque dorsali et in petiolo plerumque subdense pilosa, in parte superiore glabrescentia. Folia radicalia ± petiolata florendi tempore saepissime emarcida v. ad 4 virentia late ovata v. ovato-oblonga, denticulata v. dentata, dentibus apice glanduliformibus, obtusiuscula mucronata, interiora ovata v. oblongo-lanceolata breviter acuminata mucronata, in petiolum interdum sublongum alatum v. haud alatum (vulgo superne late alatum) decurrentia; caulina (3—) 4—5 (rarius ad 8) breviter acuminato-acutissima, imum late lanceolatum in petiolum sublongum late alatum basi distincte amplexicaulem sensim attenuatum, denticulatum v. basin versus ± grosse dentatum, media late lanceolata basin versus angustata sed basi ipsa dilatata subpanduriformia semi- vel magis amplexicaulia, superiora late vel ovato-lanceolata basi truncata ± amplexicaulia, in bracteas lanceolatas v. anguste lineares acutissimas ramorum transeuntia. Inflorescentia plerumque determinata, superne laxe paniculata ramis (0—) 3—4, 1—2 cephalis, rarius ex alis foliorum superiorum ramis 1-pleiocephalis praedita, (1—) 2—5 (—25) cephalis, acladium 10—30 mm longum. Involucrum 10—11 mm longum subnigrum, squamis subangustis obtusiusculis v. acutiusculis apice barbulatis, pilis canescentibus v. obscurioribus brevibus (1,5 mm) vix modice numerosis, glandulis subdensis obsitis, interioribus dilutius marginatis v. immarginatis, subeffloccosum. Pedunculi erecti v. basi arcuati subdense longeque glandulosi, pilis subsetosis ± obscuris ad 1,5 mm longis submodice numerosis v. dispersis obsiti, superne subcanofloccosi; flocci deorsum cito, glandulae sensim deminutae usque ad caulis basin descendentes, pili deorsum mox diluti. Flores lutei, ligulis apice ciliatis, stylis obscuris; achaenia rubro- v. obscure brunnea.

Variat: α) **Freynianum** Velenovsky, Österr. bot. Zeitschr. 1883 p. 389 (*H. tenue* Freyn in sched.; *H. albinum* Freyn, in Flora 1881 no. 14; *H. bohemicum-corconticum* Uechtr., Jahresb. schles. Ges. vaterl. Kult. 1883 (1884) p. 11—13); caule elato 40—50 cm alto polycephalo; foliis caulinis 7—10; inflorescentia laxissima, ramis numerosis etiam ex alis foliorum caulinorum superiorum

ortis; acladio longiore; pedunculis arcuato-ascendentibus; foliis obscure viridibus distincte glaucescentibus, caulinis ad 10:3 cm longis profundius dentatis, dentibus maioribus margini basin versus insertis. — In montibus Asciburgensibus: Krkonoš, Melzergrube, Kiesberg (Krause, Fiek, Freyn, Velenovsky).

β) **Trautmanni** Uechtr., Jahresber. schl. Ges. 1883 (1884) p. 14; caule ad 35 cm alto (3—) 4—5 foliato oligocephalo; pedunculis magis appropinquantis strictis raro subarcuatis; foliis dilute viridibus parum glaucescentibus, radicalibus petiolatis, petiolis laminam aequantibus v. longioribus, caulinis ad 6:2 cm longis denticulatis v. dentatis, dentibus maioribus medio margini insertis. — In montibus Asciburgensibus: Kesselkoppe, in declivitatibus australibus m. Krkonoš (1250—1300 m), Spindlerbaude (K. Knaf), Elbgrund (Čelakovsky).

Exsiccata: Flora Austro-Hung. no. 3378.

Tab. 242, Fig. B. 3, 4. *H. corconticum* K. Knaf. fil. ssp. *corconticum* β) *Trautmanni* Uechtr. (e m. Krkonoš, leg. E. Fiek). 3. Squama. 4. Pedunculus sub involucrio.

Subspecies **asperulum** Freyn, in Flora 1881 no. 14 p. 217; *H. juranum* β) *elongatum* Čelak., Nachtr. Prodr. Fl. Bohem. — Caulis 20—40 cm altus plerumque obscurus, subglaber, basin versus tantum sparsim, raro ubique ± modice pilosus v. setis dispersis brevibus obscuris praeditus, infra inflorescentiam setis solitariis nigris floccisque sparsis obsitus, hypophyllopodus v. aphylllopodus, rarissime phyllopodus, saepe ± flexuosus. Folia dilute viridia subglaucescentia per exsiccationem plerumque lutescentia, subglandulosa; radicalia oblongo-lanceolata in petiolum angustata acuta v. subobtusiuscula, glanduloso-denticulata, florendi tempore fere semper emarcida; caulina 4—6 (—8) remota, elongato-lanceolata, media superioraque in acumen longum tenue angustata, plerumque ± remote tantum denticulata, interdum medio et ad basin glanduloso-dentata, imum in petiolum late alatum basi distincte semiamplexicaulem sensim angustatum, proxima 2—3 basi lata plus semiamplexicaulia, summa etiam basi lata sed paulo minus amplexicaulia. Inflorescentia paniculata, caulomata setis nigris floccisque solitariis obsita, acladium (5—) 10—20 mm longum, rami 3—5, inferiores saepe remoti, capitula (1—) 3—4 (—15). Involucrium 9 (—10) mm longum ovatum; squamae plerumque latiusculae, nigrae, obtusiusculae, sparsim floccosae, apice distincte barbulatae, plerumque dilutius marginatae, pariter ac pedunculi superne subfloccosi inferne floccosi pilis brevibus obscuris dispersis v. sparsis glandulisque brevibus dispersis v. modice numerosis obsitae, rarius pedunculi subepilosi basi fere glabri. Flores lutei, ligulis apice breviter ciliatis, stylis obscuris; achaenia brunneo-atra.

In m. Asciburgensibus: Kesselkoppe 1450 m (G. Schneider), in declivitatibus australibus m. Krkonoš 1320—1345 m (Freyn).

Exsiccata: Fl. Austro-Hung. 3377.

Tab. 242, Fig. A. 1, 2. *H. corconticum* K. Knaf ssp. *asperulum* Freyn (in m. Kesselkoppe, leg. A. Scholz). 1. Squama. 2. Pedunculus sub involucrio.

135. Hieracium chlorocephalum (Wimm., Jahresb. schles. Ges. 1845 sine descript.) Uechtr., Österr. bot. Zeitschr. 1872 p. 311; = **prenanthoides—alpinum—vulgatum** Zahn, in Koch Syn. 1901 p. 1891. — Iulio—Aug.

Subspecies **stygium** Uechtr., 53. Jahresb. schles. Ges. 1875 (1876) p. 146; Fiek, Fl. Schles. 1881 p. 271; *H. plumbeum* b) *elatus* Fr., Epicr. 1862 p. 95. — Phyllopodum v. interdum hypophyllopodum, rarius aphyllpodum et caulis supra basin rosulis foliosis praeditus. Rhizoma saepe pluricaule. Caulis (10—) 15—35 (—45) cm altus subgracilis v. tenuis ± flexuosus erectus striatus, basi pariter ac foliorum petioli brunneo-rubescens. Folia obscure viridia saepe subglaucescentia, subtus subpallidiora, rigida; radicalia 2—6, extima ± spatulata subparva distincte glandulosa, sed in rosulis novellis tantum evoluta, reliqua (exteriora) late v. ovato-lanceolata obtusiuscula v. acutiuscula, florendi tempore saepe emarcida, 1—3 (interiora) tantum virentia vulgatiformia lanceolata, sensim in petiolum longum attenuata, utrimque dentibus compluribus apice glanduliformibus denticulata, rarius integerrima v. subintegerrima, sublonge acuminata acuta; caulina (2—) 3—4 (—5) sensim decrescentia, imum v. inferiora 2 radicalibus similia ± longe petiolata, reliqua basi ± angustata sessilia v. subamplexicaulia. Inflorescentia altefurcata vel laxe paniculata ± suprafastigiata indeterminataque; capitula (1—) 2—4 [rarius compluria; in planta culta v. rarissime in spontanea vegeta, rami ad 5 (—6), ordines axium 3, capitula 10 (—14)]; acladium (5—) 10—25 (—45) mm longum, rami 1—2 (—4), inferior v. inferiores remoti oblique erecti v. subarcuati 1—2 (—3) cephal. Involucrum (10—) 11—13 (—14,5) mm longum semiglobosum denique ± ventricosum basi truncatum; squamae latiusculae obtusiusculae v. (interiores) ± acutiusculae, valde nigrae, interiores pallidiores et dilute submarginatae. Bractee 1—3. Pili in involucrio pedunculisque sparsi v. modice numerosi subatri subsetosi, in caulomatibus deorsum consimiles diluti, caulis basin versus densi molles 2—3 mm longi, superne breves, in foliis utrimque + modice numerosi v. subnulli breves subsetosi, in margine nervoque dorsali et in petiolo subdensi, 1 (—2) mm longi. Glandulae in involucrio pedunculisque dispersae v. subnumerosae, in caule usque ad basin descendentes et + dispersae, in foliorum margine dispersae vel sparsae. *Flocci* involucri plerumque sparsi, pedunculi cani, caulis ± dense v. deorsum saepe usque ad basin disperse floccosus, folia in nervo dorsali tantum interdum disperse floccosa. Flores dilute aurei, ligulae angustae saepissime complicatae, apice + obsolete ciliatae, stylus obscurus; achenia atrobrunnea.

Variat: 1) normale Z., involucrio pedunculisque sparsim mediocriterve pilosis;

a) *verum*, caulomatibus foliisque subpilosis. — Sudeti, Carpathes.

b) *calvescens*, caulibus foliisque ± calvescentibus. — Sudeti.

2) pilosius Z., involucrio pedunculisque subdense pilosis minus glandulosis. — Carpathes orientales: Czorna Hora.

Caulis 40—80 cm altus gracilis v. crassiusculus intense (saepe anguloso-) striatus, infra medium subpilosus vel epilosus, basin versus tamen fere semper subpilosus, ubique dense glandulosus, aphyllopodus v. hypophyllopodus. Folia caulina 8—12 vel compluria, sensim in bracteas decrescentia, ima \pm longa magnaue, late lanceolata, basin versus angustata v. \pm panduriformia, amplexicaulia, media ovato- v. elliptico-lanceolata, sub- vel haud panduriformia valde amplexicaulia, superiora basi cordata \pm amplexicaulia, omnia \pm breviter acuta mucronata, \pm denticulata, sublutescenti- v. saturate viridia \pm glaucescentia, subtus pallidiora, vix v. obsolete reticulato-venosa, mollia, epilosa v. in margine nervoque dorsali disperse modiceve pilosa, 0,5—1 (—2,5) mm, modice v. dense glandulosa. Inflorescentia paniculata \pm squarrosa, indeterminata vel instar *H. bupleurifolii* \pm determinata, v. caulis ex omni ala ramus, ramis longis oblique patentibus foliosis. Acladium 15—30 mm longum, rami 8 v. numerosi graciles v. tenues dense glandulosi 1—2 (—3)-pliciter ramulosi, capitula (8—) 20 vel copiosa. Involucrum 10—12 mm longum cylindrico-ovatum basi rotundatum v. denique truncatum, squamis angustis obtusiusculis v. acutiusculis et acutis, obscure vel saepe \pm viridi-canescens, dilutius marginatis apice barbulatis, pariter ac pedunculi densissime luteolo-glandulosi et dense floccosis. Bracteae 1—3 saepe subfoliolaceae. Flores lutei, ligulis apice \pm glanduloso-ciliatis, stylo obscuro; achaenia dilute rubro-brunnea; receptaculum plerumque intense ciliatum. — Flor. Aug.—Sept.

In ditione *H. amplexicaulis* in Pyrenaeis, Delphinatu, Pedemontio et Vallesia.

1. Folia tantum glandulosa, vel ima caulina basin versus tantum pilis sparsis adspersa.

Subspecies **conringiifolium** Arv.-Touv., Spicileg. 1881 p. 34; Hierac. Alp. franç. 1888 p. 106. — Folia caulina media vix panduriformia, fere omnia conformia, basi \pm auriculata late cordata sessilia, denticulata vel subintegerrima, subtus obsolete reticulato-venosa. Inflorescentia \pm indeterminata longeque ramosa. Alveoli in margine \pm distincte fibrilloso-dentati et interdum subglandulosi.

Vallesia: In silva Burgerwald supra Unterbaech pr. Raron 1350 m (Bruegger), pr. Visp (Wolf); Pedemontium: Gollié in valle Cogne (id.); Delphinatus: Villard-de-Lans, Guillore, Corrençon en Lans (A.-Touv.), Briançon (Bachmeyer), la Madeleine in iugo Lautaret, infra les Bérardes in valle fl. Vénéon (W. Bernoulli); in Alpibus Maritimis Italiae: pr. Peira Cava versus Luceran (Burnat), in v. Pesio (Bicknell), S. Grato pr. Limone infra iugum Col die Tenda 1550 m (Jacquet).

Exsiccata: Soc. franco-hélv. 306; Soc. dauphin. 353; Zahn, Hieraciotheca Europ. 84, 295 (pr. Lillaz in v. Cogne 1400 m leg. Wilczek).

Tab. 249. *H. ramosissimum* Schl. ssp. *conringiifolium* A.-T. (e monte Aurouze pr. Gap, Hautes-Alpes, leg. Brachet). 1. Squama. 2. Pedunculus sub involucri.

Huc pertinet etiam ssp. *lactucifolium* A.-T., Monogr. 1873 p. 44; Addit. à Monogr. p. 17; Spicileg. p. 33; Hier. Alp. fr. p. 105; foliis in parte aversa distincte reticulato-venosis, caulinis mediis distincte panduriformibus, inferioribus in petiolum alatum basi latiore auriculatum angustatis; inflorescentia subdeterminata; alveolis in margine tenuiter fibrilloso-dentatis; habitu *H. bupleurifoliodis*. — Delphinatus, Pedemontium.

1* Folia in margine (glandulosa et) breviter pilosa.

Subspecies *ramosissimum* Schleich. l. c.; *H. lactucaefolium* 2. *H. Helveticum* A.-T., Spicileg. 1881 p. 33; non Suter, Fl. Helv. ed. 1 (1802); *H. lactucaefolium* var. *runcinatum* A.-T., Essai classif. p. 12 et Hier. Alp. franç. p. 105; *H. ramosissimum* α) *Schleicheri* Burnat et Gremli, Hier. Alp. marit. p. 20; *H. runcifolium* A.-T., in Wilczek, Notes Hier., Bull. Soc. Murith, fasc. XXXI p. 108; *H. adenoclinium* Besse, in Bull. Soc. Murith. XXXII 1903 p. 186. — Folia caulina media haud panduriformia, omnia conformia, basi lata v. auriculata amplexicaulia, subtus vix reticulato-venosa, in margine praecipue basin versus leviter sinuato- et glanduloso-denticulata. Inflorescentia indeterminata et longe squarroso-paniculata. — Verosimiliter formulae *prenanthoides*—*pulmonarioides* respondens.

Vallesia: Conthey 1900 m, Pas de l'Ours de Lens, Liddes, Isérables (Besse), Vercorin (Favrat), Painsec (Wolf), Pontis (Bernoulli), Tourtemagne, Unterbaech (Wolf), Visp, Stalden, Zeneggen, Staldenried (Schleicher, Wolf), Visperterminen (Bruegger), Kalpetran et in valle St. Nikolaus (Christener), Toerbel (Spencer), Ganter (Favrat), Algabi (Jaccard), inter Naters et Belalp (Wolf); Pedemontium: Flora Valdostana: inter Étroubles et Gignod (Favrat), Pré-St.-Didier → La Thuille (Vaccari), Vieyes, Lillaz, Crêt, Chavanis, Gollié, Valsaravanche, Val Grauson (Mueller-Aargov., Wolf, Besse). — Delphinatus, Alpes Maritimae.

Exsiccata: Soc. dauph. 853^{bis}; Soc. franco-hélv. 767.

Tab. 250. *H. ramosissimum* Schl. ssp. *ramosissimum* Schl. (prope Grengiols Vallesiae leg. Jacquet). 1. Squama. 2. Pedunculus sub involucri. 3. Margo foliorum.

Adnotatio: *H. Arpadianum* Zahn, in Reichb. Icones XIX 2 p. 132, tab. 110, ut nunc cognovimus, est species intermedia inter *H. amplexicaule* et *H. integrifolium* Lange, ergo formulae (*prenanthoides* > *silvaticum*)—*amplexicaule* respondens.

France XLI (1894) p. 363; *H. prenanthoides* > *albidum* Zahn, in Koch Syn. 1901 p. 1896; *H. cydoniaefolium* × *prenanthoides* Huter in sched. 1881; *H. juranum* × *pseudopicris* A.-T. apud Huter in sched.; = *prenanthoides* > *intybaceum* Zahn, Hierac. d. Schweiz 1906 p. 497.

Caulis ad 75 cm altus gracilis v. crassus, aphyllopodus. Folia caulina 10—15 submagna elongata late lanceolata approximata sensim decrescentia, media basin versus ± attenuata ± panduriformia, superiora e basi cordato-ovata acuminata, inferiora basin versus longe attenuata basi subpetiolata sessilia, omnia semiamplexicauli acuminata tenuiter glanduloso-denticulata, saturate subtus glaucescenti-viridia et reticulato-venosa, glabrescentia v. supra subrigidiuscule, subtus molliter breviterque subpilosa, in margine nervoque dorsali semper breviter pilosa. Inflorescentia paniculato-corymbosa, $\frac{1}{4}$ — $\frac{1}{3}$ totius caulis exhibens, poly-

cephala; aeladium 10—20 mm longum, rami \pm remoti, oblique et \pm squarros-patentes, apicem versus 2— (vel 3—) pliciter ramulosi, densissime longeque glandulosi modiceque floccosi. Involucrum crasse cylindrico-ovatum denique truncatum, 10—12 mm longum, squamis subangustis v. sublatiusculis obtusis v. obtusiusculis apice barbulatis, obscure canis v. subatris albido-viridi-marginatis, modice v. subdense floccosis et longissime densissimeque glandulosi. Glandulae brunneo-luteae in caulem profunde descendentes, in foliis solitariae. Flores saturate lutei, ligulis apice ciliatis; achaenia dilute brunnea; stylus obscurus. — Flor. Aug.

Habitu *H. prenanthoidis* luxuriantis. Inter hoc et *H. picroides* Vill. (ochroleucum Schl.) intermedium.

In consortio parentium in Vallesia: Les Combes du St.-Bernard 2200 m (Besse), Creux de Dzéman (Wolf); Helvetia orientalis: Arosa (Chenevard), in valle Sertig pr. Davos (Zahn), pr. Samnaun (Kaeser); Tirolia: Jaufen (Huter).

Lienz (Gander), supra Heiligkreuz in v. Venter Tal 1950 m (Zahn).

2) *subcinereum* Zahn l. c., floccis in involucrio vel praecipue in pedunculis \pm densis. — Kapfloch infra iugum Simplon (Fayre), Maienwand (Favrat).

Exsiccata: Fl. Austro-Hung. 3382 (Muellitz); Zahn, Hieracioth. Europ. 386 (var. *fuscum* Z. — Heiligkreuz); 386a (var. *subcinereum* Z. — Simplon).

Tab. 253, Fig. A. 1, 2. *H. pallidiflorum* Jord. ssp. *Huteri* Hausm. 1) *fuscum* Zahn (in m. Wolfeskofer pr. Luttach Tiroliae leg. Treffer). 1. Pedunculus sub involucrio. 2. Margo foliorum.

Subspecies *subpicrioides* Zahn, Hier. d. Schw. 1906 p. 503. Inter ssp. *Huteri* et ssp. *picrioides* intermedium, foliis cauleque densissime glandulosis subpilosisque, foliis latius lanceolatis quam in ssp. *Huteri*, involucris 13—14 mm tantum longis; capitulis 2 vel paucis. — Goeschener Alpe et in alpe Forno vallis Maggia (Favrat).

144. Hieracium kalsianum Huter, Exsicc. (1867); Naeg. Pet., Hier. Mitteleurop. II (1886—1889) p. 228; *H. ochroleucum—villosum* Zahn, in Koch Syn. 1901 p. 1899; *H. villosum—(prenanthoides—albidum)* N. P. l. c.; = *picrioides—villosum* Zahn, Hier. d. Schw. (1906) p. 503. Aphyllopodum. Caulis 30—45 cm altus. Tota planta disperse glandulosa et modice sat denseve pilosa. Folia caulina 5—12 submagna, omnia amplexicaulia, oblonga v. (superiora) oblongo-ovata, acuta, \pm dentata, lutescenti-viridia. Inflorescentia laxa paniculata, acladio 5—30 mm longo, ramis 1—3 subremotis gracilibus, capitulis 2—4 (—8) crasse cylindrico-ovatis denique truncatis, 13—15 mm longis. Squamae \pm latae lanceolatae acutae, apice barbulatae, atrae, \pm viridi-marginatae, modice pilosae (2—3,5 mm), dense glandulosae, modice v. in margine saepe dense floccosae. Pedunculi subdense sublongeque glandulosi. Pili in plantae partibus superioribus basi atri. Flores lutei, ligulis apice breviter ciliatis, stylis obscuris, achaeniis dilute brunneis ad 5 mm longis. — Flor. Augusto.

Habitu *H. valdepilosi* ssp. *elongati*, at differt indumento in tota planta partim glanduloso.

Subspecies *kalsianum* Huter, pilis ad 4 mm longis, glandulis in pedunculis subnumerosis, foliis superioribus in parte aversa effloccosis, achaeniis ad 5 mm longis.

Helvetia: In alpe Zotto ad Campo in pago Ticinensi (Chenevard); Tirolia: in valle Lesach infra Kals in alnetis infra m. Weisskopf haud procul a „Christinens Riese“ c. 2000 m (Huter, Zahn 1909).

Exsiccata: Fl. Austro-Hung. no. 3331.

Tab. 254. *H. kalsianum* Huter ssp. *kalsianum* (Huter) N. P. (loco classico leg. Huter).
1. Apex ligularum. 2. Squama. 3. Pedunculus sub involucri. 4. Margo foliorum.

Subspecies **ochroleucopsis** Zahn, Hier. d. Schw. p. 503; *H. kalsianum* ssp. *adenophorum* N. P. II p. 229 p. p.; nec Scheele, in Linnaea XXXII p. 682. Pilis in caule ad 8 mm longis, glandulis in pedunculis foliisque sparsissimis parvisque, foliis superioribus subtus saepe subfloccosis, acheniis ad 3,8 mm longis, squamis longe acutis.

Helvetia: In alpe Botenalp m. Faulhorn pr. Grindelwald (Mueller).

145. Hieracium macrocephalum Huter (1856) in sched.; Zahn, in Koch Syn. (1901) p. 1899 = **pallidiflorum—kalsianum** vel **pallidiflorum** > **valdepilosum** Zahn l. c. — Habitu ut in *H. pallidiflori* ssp. *Huteri*. Caulis 15—30 (—40) cm altus subtenuis v. gracilis, erectus v. ascendens et subflexuosus, pariter ac folia et margo foliorum pilis rigidis albidis basi atris ad 3 mm longis dense hirsutus, aphyllopodus. Folia caulina 10—15 appropinquata, sensim in bracteas foliolaceas decrescentia, lanceolata v. ovato-lanceolata, sensim acuminata acuta, inferiora basi cuneata ± subamplexicaulia, media basi lata v. pariter ac superiora basi rotundata sessilia et ± semiamplexicaulia, omnia glanduloso-denticulata vel ± serrato-denticulata, ± rigida, viridia v. sublutescenti-viridia, subtus subpallidiora distincte venosa vix reticulato-venosa. Inflorescentia laxa paniculata usque ad caulis medium descendens, (1—) 2—4 (—6)-cephala, acladio 5—30 (—50) mm longo, ramis (0—) 1—4 subarcuato-ascendentibus subgracilibus monocephalis v. simpliciter ramulosis¹⁾. Involucrium 15—16 mm longum ventricosum-globosum denique depressum, squamis numerosis e basi latiuscula sensim acuminatis obtusiusculis v. interioribus acutiusculis, atroviridibus dilutius marginatis. Bracteae 1—3. Pili in involucrio nulli v. solitarii, in pedunculis dispersi v. modice numerosi. Glandulae in involucriis pedunculisque densissimae (more *H. pallidiflori*), in caule usque ad basin descendentes, in foliis subnumerosi v. dispersi. Flocci in involucrio sparsissimi, pedunculi dense floccosi, caulis usque ad medium deminute subfloccosus. Flores saturate lutei, ligulis apice parum ciliatis, stylis obscuris, acheniis dilute brunneis. — Flor. Aug.

Tirolia: In valle Lesach pr. Kals, loco „Tschamp“ dicto in alnetis ad pedem m. Weisskopf haud procul ab „Christinens Riese“ (Huter, Zahn 1909) 2000 m rarissime; Schleinitz pr. Lienz (Gander).

Exsiccata: Flora Austr.-Hung. exs. no. 3386 (planta culta).

Tab. 255. *H. macrocephalum* Huter (planta culta, a cl. Huter distributa). 1. Squama. 2. Pedunculus sub involucri. 3. Margo foliorum.

146. Hieracium fastuosum Zahn, in Koch Syn. (1901) p. 1900; *H. heterotrichum* Ausserdorfer in litt. ad A. Kerner 1868 et herb., nec al.; *H. cydoniaefolium* × *Bocconeii* Ausserd. l. c.; *H. Schw. 1906 p. 504. — Caulis 20—50 cm altus gracilis v. crassus, flexuosus, ± sulcato-striatus, aphyllopodus v. hypophyllopodus. Folia inferiora florendi tempore emarcida; caulina 5—10 sensim decrescentia, inferiora oblongo-lanceolata basi angustata saepe subpetiolata, media ovato-lanceolata basi lata sessilia, superiora basi rotundata v. subcordato-ovata sessilia, omnia sub- vel semi-

¹⁾ Planta culta a. cl. Huter distributa ramis ad 8 capitulisque ad 15 praedita est.

amplexicaulia acuminata acuta, glanduloso- et serrato-dentata. Inflorescentia laxè paniculata (1—) 2—5 (—12) cephalà, acladio 8—20 mm longo, ramis (0—) 1—3 (—5) oblique erectis crassiusculis monocephalis v. simpliciter ramulosis. Involucrum magnum ad 18 mm longum crasse ventricosum denique depressum, squamis e basi lata acuminatis obtusis v. intimis acutis, atro-viridibus dilutius viridi-marginatis. Bractee 1—2 ± foliolaceae. Pili in involucris pedunculisque pariter ac in caule margineque foliorum densi 3—5 mm longi, in foliis utrimque modice numerosi. Glandulae in involucrio modice numerosae, in pedunculis cauleque usque ad basin ± dispersae, in foliis solitariae. Flocci in involucrio praesertim in squamarum marginibus ± dispersi, pedunculi canescentes, caulis usque infra medium disperse floccosus. Flores dilute lutei, ligulis apice parum ciliatis, stylis obscuris, achaeniis obscure brunneis. — Flor. Aug.

Tirolia: In alpe Kaserstatt vallis Muehlwald (Ausserdorfer).

Tab. 256. *H. fastuosum* Zahn (e loco classico!). 1. Apex ligularum. 2. Squama. 3. Portio e caulis medio. 4. Margo foliorum.

Subspecies **trichopicris** Zahn, in Schinz et Kell., Fl. d. Schw. ed. 2 II (1905) p. 339; Hier. d. Schw. 1906 p. 504. Habitu *H. picrioidis* ssp. *picrioidis*, sed involucris pedunculisque pariter ac reliquae plantae partes modice vel subdense pilosis (1—1,5 mm). Caulis subtenuis, ad 30 cm altus, usque ad basin disperse glandulosus. Folia caulina 8—12 oblongo-lanceolata, superiora latiora brevioraque, inferiora basi angustata v. subpanduriformia, media basi lata, superiora basi subcordata sessilia et ± amplexicaulia, omnia dilute viridia denticulata, modice pilosa disperseque glandulosa. Acladium ad 6 cm longum, rami pauci tenues, capitula 2—6. Involucrum 10—12 mm longum, squamis e basi latiuscula acuminatis acutis subatris modice floccosis pariter ac pedunculi ± dense glandulosis. Flores lutei, ligulis apice breviter ciliatis, stylis obscuris, achaeniis brunnescentibus. — Fl. Augusto.

Helvetia: In declivitatibus septentrionalibus vallis lateralis Langental in v. Egental pr. Ulrichen 21—2200 mm legi.

147. Hieracium pseudostenoplectum Zahn = **picrioides—iuranum** Zahn, Koch Syn. 1901 p. 1900; *H. iuranum—ochroleucum* Zahn l. c. — Flor. Aug.

Subspecies **pseudostenoplectum** Zahn l. c. et Hier. d. Schweiz 1905 p. 505. Hypophyllopodum, rarissime phyllopodum. Caulis 40—50 cm altus gracilis, inferne subpilosus. Folia caulina c. 8—10 submagna sensim decrescentia ± remota (praecipue superiora), ima, ± cito vel sensim in petiolum longum angustata elliptico- vel oblongo-lanceolata, sequentia basi angustata sessilia subamplexicaulia, media summaque basi lata vel subcordiformia amplexicaulia, omnia glanduloso-denticulata v. grosse dentata subglaucescentia dilute vel lutescenti-viridia mollia, supra disperse pilosa vel glabrescentia, subtus et praecipue in margine nervoque dorsali submodice pilosa. Inflorescentia paniculata, acladium ad 30 mm longum, rami primarii ad 7 subtenues vel subgraciles appropinquati vel remoti, ordines axium 2—3 capitula pauca vel ± numerosa. Involucrum cylindrico-ovatum 10 mm longum, squamis angustis obscuris ± dilute marginatis obtusis vel obtusiusculis disperse floccosis, sed densissime sublongeque glandulosis, pedunculi caulomataque consimilia. Folia glandulis nonnullis (praecipue in nervo dorsali et in margine) obsita. Flores lutei, ligulae apice ciliatae, stylus atriuseculus, achaenia brunneo-atra.

Habitu *H. iurani*, sed inflorescentia laxè paniculata; involucria, pedunculi et caulomata

(superne) densissime et subgrosse glandulosa, folia semper glandulis nonnullis praedita. Interdum 1—2 folia radicalia evoluta sunt.

Habitat in consortio *H. picrioidis* in *Helvetia*: Grd St.-Bernhard: Les Combes (A. et C. Touton), Pradaz (Besse); Creux de Dzéman (Favrat), Simplon (id.), Maienwand (Zahn), in vallibus Dischma et Sertig et in alpe Drusatscha pr. Davos (de Tavel, Zahn), in m. Eckberg pr. St. Antönien (Brügger). In m. Camoghé 1750 m (Jäggli). In m. Petit St.-Bernard florum Valdostanae (Vaccari). — *Tirolia*: In vallecula Jaufental supra viculum Schluppes (Huter).

Variat: 1) maioriceps Zahn, Hier. d. Schw. l. c., involucri 10—11 mm longo subdense floccoso; planta robusta. — In valle Sertig (Zahn).

2) minoriceps Zahn l. c., involucri minore, ad 10 mm longo atriusculo.

a) *verum* Z. l. c. — Omnibus locis superne citatis.

b) *ramosum* Z. l. c., caule ex omni ala longe ramoso. — In v. Sertig.

Tab. 257. *H. pseudostenoplectum* Zahn (in valle Sertig legi). 1. Squama. 2. Pedunculus sub involucri. 3. Margo foliorum glanduloso-dentata.

Sectio XV. **Tridentata** [Fries, Epicr. p. 115; Arv.-Touv., Hier. Alp. franç. p. 118; Zahn, in Koch Syn. p. 1901; Stirps *H. vulgati* Fr. Symb. p. 103 p. p. et stirps *H. tridentati* Fr. l. c. p. 168; *Pseudopulmonarea* et *Umbellata* p. p., Fries Epicr., p. 113 et 132]. — Aphyllipodium, haud raro phyllipodium vel hypophyllipodium; inflorescentia paniculata, interdum superne umbellata; squamae adpressae, saepe ± irregulariter imbricatae, plerumque sparsim pilosae, glandulosae floccosaeque, interiores angustatae obtusae vel acutiusculae; achaenia matura obscura; receptaculum dentatum; folia caulina plerumque haud ita numerosa, aequaliter distantia, ima ± subpetiolata, media basi angustata sessilia, nunquam amplexicaulia plana, omnia vulgo subangusta. Floret Julio et initio Aug.

Huc pertinent *H. laevigatum* Willd., *H. rigidum* Hartm., *H. tridentatum* Fr., *H. gothicum* Fr. p. p., *H. lapponicum* et aliae „species“ scriptorum classicorum. Ex mea sententia hae „species“ omnes inter *H. umbellatum* et *H. vulgatum* intermediae et uni speciei: ***H. laevigato*** adscribendae sunt. *H. laevigatum* ergo formulae **umbellatum—vulgatum** respondere pro certo habeo.

148. Hieracium laevigatum Willd., Hort. Berol. I (1816) tab. 16; Sp. pl. 3 p. 1590; herb. no. 14 722 apud Sch.-Bip.; Froel., in DC. Prodr. VII p. 220; Koch, Syn. ed. 1 p. 461; Arv.-T., Monogr. p. 46; Zahn, in Koch Syn. (1901) p. 1901; Hier. d. Schw. p. 506. — Huc pertinent: *H. tridentatum* Fr., Nov. Cl. Friesius primo (Nov. Mant. II p. 48, Herb. normale III₄, V₁, IX₃, XII₁₃) *H. tridentatum* et *H. rigidum* duas species diversas esse declaravit. In Epicrisi (p. 116) *H. rigidum* Herb. norm. IX 3 ad *H. tridentatum*, sed ibidem p. 133 ad *H. rigidum* Hartm. citavit

et transtulit. Etiam Hartmann, Fl. Scand. ed. 5 (1849) p. 24, *H. rigidum* ab *H. tridentato* haud separavit.

Per totam Europam usque ad zonam arcticam et per Sibiriam ad Mandchuriam, etiam in terris Caucasiacis et in America boreali.

Disposito gregum etc. vide Zahn, Hierac. d. Schweiz (1905) p. 507.

Subspecies **amaurolepis** Murr et Zahn, in Zahn Hieracioth. Europ. sched. ad cent. I p. 26 (1906); *H. gothicum* auct., nec Fr. [cfr. Dahlst., Bidr. sydöst. Sverig. Hierac.-Fl. III (1894) p. 174]. Caulis 30—50 cm altus gracilis strictus rigidus striatus, inferne violaceus et breviter subpilosus, superne viridis epilosus eglandulosus interdum sparsim floccosus, hypophyllopodus v. plerumque aphylllopodus. Folia caulina 5—9 sensim decrescentia rigidiuscula saturate viridia late lanceolata irregulariter breviterque sinuato-dentata vel saepissime breviter dentata vel denticulata pluridentata (haud grosse dentata, non dentibus 3—4 multo maioribus praedita), supra glabra sublucida vel inferiora marginem versus sparsim pilosa, subtus sparsim breviterque pilosa et floccis saepe indistinctis praedita vel in margine nervoque dorsali subfloccosa simul subciliata, inferiora basi subangustata, media basi fere rotundata sessilia, superiora consimilia, subtus subfloccosa. Inflorescentia paniculata, acladium 5—25 mm longum, rami primarii (1—) 2—3 (—5) subremoti 1-cephali vel simpliciter ramosi, capitula (2—) 3—8 (—15). Involucrum ovatum crassiusculum denique depressum 10—11,5 mm longum, squamae latiusculae lanceolatae obtusiusculae vel acutiusculae satis imbricatae atrovirides v. subatrae fere effloccosae disperse breviterque glandulosae epilosae vel rarissime pilis valde solitariis praeditae. Pedunculi sat tenues apice paulum incrassati dense floccosi epilosi fere semper eglandulosi, bracteis 3—4 squamiformibus obsiti. Ligulae saturate luteae apice glabrae, stylus denique fuscus, achaenia atro-brunnea.

Variat: a) *verum* Z. — In montibus Hercynicis, in Vogesis, Sudetis, Carpathis, in m. Feldberg Badenae. — Exsicc.: Zahn, Hieracioth. Europ. cent. I no. 88 (e m. Feldberg).

b) *subnigrum* M. et Z., squamis latioribus fere atris, foliis glabrioribus. — Tirolia: Supra viculum Schluppess c. 1500 m in v. Jaufental pr. Sterzing (Huter), pr. Trins in valle Gschnitz (A. Kerner), pr. Luttach (Treffer) etc. — Exsicc.: Zahn, Hieracioth. Europ. no. 89; Doerfler, Herb. norm. 4395 (e valle Jaufen, leg. J. Murr).

Tab. 259. *H. laevigatum* Willd. ssp. *amaurolepis* M. et Z. b) *subnigrum* M. Z. (e valle Jaufental, leg. J. Murr). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies **megalothyrsus** M. et Z., apud Murr, Deut. bot. Monatssehr. 1902 p. 74; Zahn, Hieracioth. Europ. no. 86. Caulis gracilis v. crassus ad 120 cm altus viridis sulcato-striatus disperse breviterque pilosus superne subfloccosus, basi \pm violaceus, aphylllopodus. Folia caulina ad 40 valde sensim decrescentia, inferiora lanceolata ad 12 cm longa, 2,5 cm lata utrimque attenuata \pm acuta, ima subpetiolata florendi tempore plerumque emarcida, sequentia basi longe angustata sessilia, reliqua sensim angustiora basi brevius attenuata vel (superiora) anguste lanceolata basi paulum attenuata vel fere aequilata subrotundata sessilia acutiora, omnia rigidiuscula vel subcoriacea saturate viridia, supra glabra subnitentia, in margine saepe paulum revoluta irregulariter subgrossequae serrato-dentata, dentibus 2—4 maioribus varie longis parvis intermixtis munita et pilis brevibus modice ciliata, subtus pallidiora distincte venosa disperse brevissimeque pilosa sparsim floccosa, in nervo dorsali

obscuriore disperse vel modice pilosa, superiora brevius dentata et utrimque subfloccosa. Inflorescentia paniculata, saepe valde ramosa usque ad $\frac{1}{2}$ totius caulis descendens, ramis numerosis elongatis saepe curvatis oblique patentibus foliis parvis obsitis apice ramulosis composita, aeladium 20—30 mm longum, ordines axium 3—4, capitula 30 vel compluria. Involucrum 10 mm longum ovatum, squamis latiusculis obtusiusculis vel interioribus acutiusculis subirregulariter imbricatis viridi-atris breviter subglandulosis epilosis effloccosis, exterioribus multo minoribus angustioribus subaxis basi subfloccosis. Pedunculi subtenues apice parum incrassati 2—3 bracteati subdenseque floccosi, deorsum cito valde deminute floccosi, disperse brevissimeque glandulosi subepilosi. Flores lutei, stylus denique obscurus.

Tirolia sept.: Secundum rivum Mellach inter Kematen et Rotenbrunn in valle Sellrain prope Innsbruck (de Sarnthein, Murr, Poell).

Exsiccata: Zahn, Hieracioth. Europ. no. 86 (e loco class., leg. Poell); Doerfl., Herb. norm. 4361.

Tab. 258. *H. laevigatum* Willd. ssp. *megalothyrsus* M. et Z. (leg. J. Murr).

Subspecies **deltophylloides** Zahn, in Koch Syn. 1901 p. 1927 (pro *leiopsi*—*vulgato*). Caulis ad 60 cm altus, inferne subpilosus, superne subfloccosus, gracilis, basi violaceus. aphyllopodus; rhizoma saepe pluricaule. Folia caulina 10—15 sensim decrescentia, inferiora subrhomboideo-lanceolata utrimque attenuata acuta subpetiolata vel pariter ac media basi angustata sessilia, superiora anguste lanceolata vel in formis putatis ovato-lanceolata vel fere ovalia basi rotundata sessilia, omnia rigida v. subcoriacea utrimque serrato-3—4-dentata, saturate viridia, supra glabra subnitentia, subtus pallidiora disperse brevissimeque pilosa et (praecipue media et superiora) subfloccosa, in margine breviter ciliata, summa utrimque subfloccosa minus dentata. Inflorescentia paniculata suprafastigiata, aeladium ad 25 mm longum, rami primarii plerumque pauci remoti, ordines axium 3—4, capitula pauca vel ad 15. Involucrum ad 9 mm longum ovatum, squamis subirregulariter imbricatis sublatiusculis obtusiusculis v. acutiusculis viridiatris plerumque epilosis sparsim brevissimeque glandulosis basin versus subfloccosis. Pedunculi subcani 1—2 bracteati epilosi, interdum una altera glandula brevi obsita. Flores saturate lutei, stylis obscuris.

Tirolia borealis: In pratis declivibus muscosis inter larices ad Egerdach pr. Innsbruck, 600 m, Hall (Murr), Patsch (de Benz sub norm. *Ausserdorferi*).

Exsiccata: Zahn, Hieracioth. Europ. no. 87 (e loco class., leg. J. Murr). Planta publicata est forma putata ssp. *deltophylloides*, foliis remotis ovato-lanceolatis tantum denticulatis, squamis latiusculis obtusis v. obtusiusculis plerumque eglandulosis epilosis. Quotannis Junio ante florem secatur, quare vix aliter ac „putatum“ (autumno) provenit.

151. Hieracium Harzianum Zahn = **laevigatum—franconicum** Zahn = **laevigatum—(silvaticum—bupleuroides)** Zahn, Allgem. bot. Zeitschr. (1906) no. 3.

Subspecies **Harzianum** Zahn l. c. Habitu *H. laevigati*. Caulis 60—70 cm altus crassus subsulcato-striatus breviter subsparsumque pilosus, superne breviter subglandulosus et sat dense medioeriterve floccosus, inferne subfloccosus vel fere effloccosus, basin versus intense violaceus, hypophyllopodus vel aphylllopodus, haud raro ex omni ala squaroso-ramosus. Folia radicalia complura ad 18 cm longa lanceolata, utrimque longe attenuata acuta, in petiolum late alatum basi subvaginantem decurrentia, 2—3 dentibus lanceolatis antrorsum versis ad 8—10 mm longis munita, sed florendi tempore pariter ac plerumque caulina inferiora emarcida; caulina 20—25 sensim decrescentia lanceolata, maiora 10—20 cm longa 1,5—3,5 cm lata, utrimque longe attenuata acuta, sessilia, inferiora alato-subpetiolata, reliqua sensim breviora angustioraque, in bracteas decrescentia, omnia rigidiuscula vel subcoriacea serrato-dentata, dentibus 2—3 antrorsum arcuatis lanceolatis ad 10 mm longis munita, in superiore tertia parte integerrima, supra glabra sublutescenti-viridia glaucescentia, in margine nervoque dorsali pilis subrigidiusculis 1—2 (—3) mm longis ciliata, in parte aversa molliter breviterque subpilosa et praetera subfloccosa, in nervo dorsali densius floccosa. Inflorescentia valde indeterminata laxa paniculata squarrosa, interdum rami inferiores haud evoluti gemmas albidas formantes; rami primarii 8—30, inferiores elongati subfoliosi oblique patentes, ordines axium 4—5, capitula 20 vel valde numerosa, inferiora in ramis plerumque haud evoluta gemmiformia; acladium ad 30 mm longum, 3—5 bracteis subulatis obsitum. Involucrum 11—12 mm longum crasse ovatum denique ventricosum late depressum; squamae imbricatae sublatiusculae lanceolatae acuminatae obtusiusculae vel acutae, obscurae vel obscure virides, exteriores in margine basin versus (praecipue in capitulis iunioribus) sat dense floccosae, interiores in margine \pm late viridi-marginatae, dorso parcefloccosae, sed omnes pilis 1—2 mm longis dilutis basi atris glandulisque obscuris saepe longis modice numerosis vel minus numerosis obsitae. Pedunculi obscure virides sat dense floccosi sparsissime pilosi modice

glandulosi. Flores saturate lutei, ligulae apice glabrae, stylus initio subluteus denique brunneus, achaenia atra ad 4,5 mm longa.

Bavaria: In monte Ehrenbürg pr. Forchheim Franconiae superioris (detexit Dr. Harz Bambergensis).

Variat (pariter ac *H. franconicum*) foliis haud maculatis (1. *normale* Z. l. c.) et foliis supra eximie maculatis (2. *maculatum* Z. l. c.).

Exsiccata: Zahn, Hieracioth. Europ. no. 388.

Tab. 264. *H. Harzianum* Zahn ssp. *Harzianum* 1. *normale* Zahn (e loco classico, leg. Harz). 1. Squama. 2. Pedunculus sub involuero.

In Allg. bot. Zeitschr. l. c. aliam subspeciem: *H. pseudofranconicum* Harz et Zahn, in m. Ehrenbürg a cl. Harz detectam, formulae *laevigatum* < *franconicum* respondentem descripsi. Habitu *H. vulgati*, folia caulina tantum 7—15, caulis (15—) 20—35 cm altus, involucrium 9—10 mm longum, etc.

152. Hieracium norvegicum Fries, Symb. 1848 p. 169; Epicr. 1862 p. 115; Dahlst., Bidr. Sydöstr. Sverig. Hierac.-Fl. III (1894) p. 210; Zahn in Koch Syn. 1901 p. 1906; Reichb., Comp. tab. 191 fig. 1 (1860): *laevigatum*—*saxifragum* Zahn; *laevigatum*—*Schmidtii* Zahn in Koch Syn. l. c.

Caulis gracilis ± erectus substrictus striatus, aphyllopodus vel hypophyllopodus, rarius phyllopodus, 30—70 cm altus, superne subglaber vel subpilosus, basin versus plerumque subdense pilosus et saepe ± rufescens. Folia rosularia pauca oblongo-lanceolata in petiolum alatum sensim angustata, exteriora obtusiuscula, reliqua acutiora v. acuta, denticulata v. 3—5-dentata, glandulis solitariis minutissimis obsita, florendi tempore haud raro emarcida; caulina 4—8 (—12), ima radicalibus similia sensim acuminata, basi angustata subpetiolata, 3—5 dentata, superiora ± sensim decrescentia basi ± cuneata sessilia, omnia sordide viridia subglauescentia per exsiccationem lutescentia, supra glabra lucida rarius disperse pilosa, in margine et praecipue basin versus sparsim vel sudensius setoso-pilosa, subtus disperse, in nervo mediano subdensius pilosa, pallidiora, sed variant etiam subglabra, summa subtus ± floccosa, in margine saepe subrevoluta, apice haud raro curvato-plicata, supra medium integerrima saepe subulato-acuminata, inferiora plerumque in margine nervoque dorsali ± sparsim floccosa. Inflorescentia laxa paniculata 6—15 (vel pleio-) cephalis valde suprafastigiata ± indeterminata, caulis saepe ex omni ala ramosus, acladio 15—40 mm longo, ramis 3—5 vel numerosioribus remotis oblique arcuato-erectis vel ± patentibus longis 1—2-pliciter ramulosis. Involucra submagna 10—14 mm longa globoso-ovata denique truncata, squamis subangustis vel sublatiusculis acuminatis, exterioribus brevioribus obtusiusculis, interioribus ± lanceolatis plerumque cito attenuatis obtusiusculis vel ± acutis, obscure canis ± late albidomarginatis, pilis disperse vel submodice numerosis brevibus ± dilutis, glandulis sparsis saepe minutis et floccis subnumerosis vel densis obsitis. Bracteae 3—4. Pedunculi ± canofloccosi ± sparsim glandulosi plerumque pilis solitariis praediti. Flores aureolutei, ligulis apice plerumque subglabris, stylis luteis, achaenia atra. — Flor. Iunio—Iulio.

Praecipue in *Scandinaviae* australis regionibus humilioribus pervulgatum.

Subspecies *trothanum* Zahn, caule phyllopodo v. hypophyllopodo 4—6 foliato, foliis infra medium 3—4 dentatis vix disperse pilosis, involucris (11—13 mm longis) pedunculisque sparsim glandulosis, ligulis apice glabris.

162. Hieracium pseudobupleuroides N. P. II 74 = **sabaudum—bupleuroides** N. P. I. c.

Aphyllopodium. Caulis rigidus apice ramosus. Folia numerosa \pm lanceolata, denticulata v. argute serrato-dentata, rigida, \pm glauca, in margine subtusque saepe \pm pilosa. Involucrum ut in *H. bupleuroidi*, 12—15 mm longum, denique depressum ventricosum, squamis \pm latis acutis v. obtusis sparsim pilosis parcefloccosis eglandulosis. Stylus plerumque obscurus. 60—130 cm altum. — Flor. Aug.

Subspecies **vindobonense** Wiesb., F. Sch., Herb. norm. n. s. 1409; ssp. *aquacetiense* N. P. II 76. — *H. bupleuroidi* valde affinis, at differt capitulis 14—15 mm longis, squamis latis obtusis viridibus dilutius marginatis epilosis eglandulosis parce-, in margine subfloccosis.

Austria inferior: Baden prope Vindobonam (Wiesbaur).

Tab. 282. *H. pseudobupleuroides* N. P. ssp. *vindobonense* Wiesb. (e loco classico!, leg. Wiesbaur!). 1. Squama exterior. 2. Squama interior. 3. Pedunculus.

163. Hieracium deltophyllum A.-T., Hier. Alp. fr. (1886) p. 120 = **sabaudum—vulgatum** Zahn, Koch Syn. (1901) p. 1919.

Caulis ad 80 cm altus rigidus strictus aphyllopodus, rarius hypophyllopodus, pariter ac folia haud raro ± rubro-coloratus. Folia caulina ad 12 remota vel caulis basin versus vel in caulis medio dense appropinquata (more *H. racemosi*), inferiora sensim, superiora cito decrescentia, omnia petiolata v. basi angustata, late rhomboideo-lanceolata v. lanceolata v. breviter ovata, denticulata v. grosse dentata, saturate v. sordide viridia, ± rigida v. mollia. Inflorescentia oligo- v. pleiocephala suprafastigiata; acladio 10—25 mm longo, ramis c. 5 ± remotis saepe usque ad caulis medium descendentes, 1—2-pliciter ramulosi, brevibus v. elongatis erectis. Involucrum subcylindrico-ovatum v. ovatum, squamis angustis obscure viridibus v. canescentibus obtusiusculis v. externis obtusis. Pili in involucri pedunculisque dispersi, in caule modice numerosi, 2—3,5 mm, folia in margine dense, subtus et in petiolis subpilosa, supra glabra. Glandulae in involucri pedunculisque sparsae v. subnumerosae. Flocci in involucri modice numerosi v. ± sparsi, in foliorum parte aversa subnumerosi vel in nervo dorsali tantum obvi; pedunculi ± cani, caulis deorsum deminute floccosus. Achaenia obscure brunnea. — Flor. Aug.—Sept.

Subspecies **deltophyllum** A.-T. l. c. Styli obscuri, involucris pariter ac pedunculi ± epilosis, subdense floccosis.

a. *verum* Zahn, H. d. Schweiz p. 535; foliis inferioribus submagnis, reliquis sensim decrescentibus, in caule aequaliter dispositis.

Schweiz (1906) p. 536 (incl. *H. valesianum* Fr., Epicr. 122, et *H. bifrons* A.-T., H. Alp. fr. 97) = **sabaudum—prenanthoides** Zahn, Koch Syn. (1901) p. 1921, H. d. Schw. l. c.

Caulis ad 100 cm altus, gracilis v. crassus, erectus, substrictus v. subflexuosus, submollis v. rigidus, striatus, aphyllopodus, pariter ac folia rubro- v. violaceo-coloratus. Folia caulina 15—30 v. compluria, saepe ± magna, aequaliter disposita v. in caulis inferiore parte magis appropinquata v. dense conferta, sensim decrescentia, supra medium saepe cito deminuta, ima basi subpetiolata sed florendi tempore plerumque emarcida, inferiora basi subangustata sessilia et sub- v. semiamplexicaulia, oblonga v. oblongo-lanceolata, media consimilia v. pariter ac superiora basi ± lata v. subcordata sessilia semiamplexicaulia, lanceolata, oblongo-lanceolata v. elliptica, omnia acuminata ± acuta, summa e basi ovata lanceolata et ± longe acuminata, denticulata v. dentata, basin versus saepe serrato-dentata, raro subintegerrima, obscure v. dilute viridia, subtus pallidiora et indistincte reticulato-venosa, mollia v. ± coriacea. Inflorescentia paniculata ± determinata v. saepius indeterminata, squaroso-ramosa, ramis (2—) 7 v. numerosis, inferioribus longis oblique patentibus virgatis foliosis 2 (—3)-pliciter ramulosis. Acladium 20—25 (—35) mm longum; capitula 15 vel numerosa, rarius pauca tantum evoluta, interdum pro maxima parte aborta. Involucrum 9—10 mm longum crasse v. globoso-ovatum, denique truncatum. Squamae sublatiusculae obscurae v. subvirides, dilute v. pallide viridi-marginatae, obtusae, saepe rubro-coloratae. Bractee 3—5. Pili in involucris pedunculisque vix solitarii, in ramis dispersi v. subdensi, diluti, in caule deorsum numerosiores, infra medium densi v. densissimi, 1—3 mm, in foliis utrimque subnumerosi v. subdensi breves, in margine nervoque dorsali densiores longioresque, interdum in parte superiore vix dispersis. Glandulae in involucris pedunculisque subdensae v. dispersae, interdum densissimae, plerumque parvae, in caulomatibus deorsum deminutae, usque ad medium descendentes, in foliorum marginibus solitariae minutissimae. Flocci involucri dispersi v. subdensi, pedunculi cani, caulis saepe fere usque ad basin floccosus, folia superiora in parte aversa subfloccosa, reliqua parce- v. in nervo dorsali tantum subfloccosa. Flores plerumque saturate lutei, ligulis apice vix v. breviter ciliatis, stylis subluteis v. plerumque ± obscuris. Achaenia dilute v. rubro-brunnea. Alveoli margine fibrilloso- (v. interdum subglanduloso-) dentati. — Flor. Aug.—Sept.

Delphinatus, Pedemontium, Helvetia, Jurassus, Vogesi, Silva Nigra.

In Hier. Schweiz 1906 p. 537 3 greges distinxi:

a. Pseudovalesiacum Zahn. — *H. sabaudum* proximum.

b. Lycopifolium Zahn. — Inter *H. sabaudum* et *H. prenanthoides* intermedium.

c. Bifrons Zahn. — *H. prenanthoides* magis affine.

Subspecies **trichoprenanthes** Zahn, H. d. Schweiz 538; *H. bifrons* β *trichoprenanthes* Zahn, Koch Syn. (1901) p. 1921 (e grege *Lycopifolium* Z.). Caules foliaque dense pilosa, caule infra medium dense villosa, 2—4 mm. Folia margine nervoque dorsali densissime pilosa, 1—2 mm. Involucrum subdense floccosum, pariter ac pedunculi cani subglandulosum et subpilosum. Stylus obscurus.

Pedemontium: Vieyes, Valsaravanche (Wilczek), Mt. Cénis pr. Aosta (Besse). Helvetia austro-occidentalis: Marl Sapin supra Aigle (Jaccard), Orsieres (Lagger), Mt. Chemin (Besse), Lavey (Favrat).

Tab. 285. *H. lycopifolium* Froel. ssp. *trichoprenanthes* Zahn (Mt. Chemin, leg. Besse). 1. Squama. 2. Pedunculus.

Subspecies **bifrons** A.-T., Monogr. (1873) p. 46; H. Alp. fr. 97; Zahn, H. d. Schw. p. 539; *H. vallesiacum* A.-T., Soc. Dauph. no. 2531. — Folia elliptico- v. oblongo-lanceolata,

inferiora mediaque submagna, sensim in basin semiamplexicaulem angustata, media basi subpanduriformia, superiora cito deminuta, basi rotundata v. subcordata amplexicaulia, omnia mollia, dilute viridia, saepe pariter ac caulis robustus \pm violaceo-vel vinoso-colorata, subtus \pm distincte reticulato-venosa, \pm denticulata. Involucrum 9—10 mm longum, squamis sublatiusculis subatris subimmarginatis, pariter ac rami \pm dense glandulosi. Inflorescentia saepe indeterminata, capitulis numerosissimis. Achaenia rubescentia v. obscure brunnea v. grisea.

Pedemontium: Courmayeur (Vaccari); Vallesia: Morcles, Martigny, Lourtier, Riddes Les Pontis, Vercorin, Lens, Stalden (Muret, Favrat, Wolf).

Tab. 284. *H. lycopifolium* Froel. ssp. *bifrons* A.-T. (pr. Riddes, leg. Besse). 1. 2. Squamae. 3. Pedunculus sub involucrio. 4. Dentes ligularum.

Alias subspecies in Hier. d. Schw. l. c. descripsi.

Caulis ad 120 cm altus rigidus gracilis v. crassiusculus, saepe rubescens, subglaber v. scaber v. breviter pilosus, aphyllopodus. Folia caulina ad 30 vel compluria, subappropinquata sensim decrescentia, rigida, inferiora lanceolata v. oblongo-lanceolata, rarius oblonga, utrimque attenuata, sed basi sublata sessilia subamplexicaulia, omnia acuminata acutiuscula, denti-

culata v. dentibus nonnullis maioribus obsita, obscure viridia, subtus pallidiora et distincte costata vix reticulato-venosa, praecipue inferiora subtus disperse pilosa, media summaque in parte aversa \pm dense floccosa, summa etiam in parte superiore subfloccosa, in margine \pm revoluta scabra. Inflorescentia paniculata, apice saepe umbellata. Capitula numerosa. Acladium 10—25 mm longum, involucrum \pm ovatum, 9—10,5 mm longum, squamis angustis vel sublatiusculis, obtusis, obscuris, interioribus pallide marginatis, exterioribus (praecipue in capitulis iunioribus) distincte patentibus. Bracteae complures, sub involucrio saepe confertae et in squamas transeuntes. Pili in involucriis pedunculisque nulli v. solitarii; involucrium subglandulosum, disperse v. dense floccosum; pedunculi cani \pm sparsim glandulosi, caulis sub-, apice dense floccosus. Flores stylique aureolutes v. stylus obscurus; ligulae apice glabrae. Achaenia plerumque atrobrunnea. — Flor. Aug., Sept.

Vallesia, Alsacia superior.

Subspecies **pseudocorymbosum** Greml. l. c. (= *valesiacum-umbellatum* Zahn, H. Schw. 540). Caulis saepe rubescens, subglaber v. breviter subhirsutus. Folia lanceolata v. oblongo-lanceolata, inferiora subtus disperse rigideque pilosa, superiora floccosa, in margine revoluta scabra. Involucria et pedunculi pilis solitariis obsita, involucrium sparsim modiceve floccosum.

Subspecies **adenothyrsus** Sag. et Zahn, Mag. bot. lap. (1907) p. 223. — Caulis 35—85 cm altus crassiusculus strictus viridis omnino glaberrimus v. apice tantum parcissime floccosus, hypo- v. aphyllopus. Folia inferiora supra caulis basin dense conferta, rosulam falsam c. 6-foliatam magnam formantia, interdum per rosulas secundarias etiam numerosiora, subpapyracea dilute viridia glaucescentia, obovato-lanceolata alato-petiolata. utrimque aequaliter attenuata acuta, v. basin versus longius angustata, (cum petiolo) ad 16 cm longa 4 cm lata, exteriora elliptica obtusa mucronulata, omnia remote denticulata, supra glabra sublucida, subtus subalbido-viridia disperse molliterque pilosa (3—5 mm), margine, superiora etiam in nervo dorsali modice pilosa, pilis subsetosis patentibus 4—10 mm longis (ut in *H. stuposum*); petioli basi lata vaginantes purpurascensque. Folia caulina supra rosulam falsam cito decrescentia, ad 10 (interdum 2—3 tantum) evoluta ± remota, sursum sensim decrescentia, inferiora oblongo-lanceolata paulo infra apicem latissima deorsum longe sensimque in petiolum late alatum attenuata, reliqua sensim minus attenuata subsessilia, superiora lanceolata acutissima sessilia, in bracteas inflorescentiae decrescentia, saepissime longius pilosa quam inferiora. Inflorescentia subindeterminata paniculata, acladio 10—25 mm longo, ramis primariis (2—) 4—7 (—10), ordinibus axium 3 rarissime 4, capitula (3—) 6 v. subnumerosa (interdum ad 40), sed rami inferiores plerumque abbreviati, capitulum terminale tantum evolventes v. omnino gemmiformes. Involucrum ad 9 mm longum globoso-ovatum, magnitudine ut in *H. silvatico*, atroviride; squamae imbricatae subangustae acutiusculae v. acutae atro-virides dilute viridi-marginatae, apice breviter barbulatae basin versus in margine subfloccosae, ubique sat dense glandulosae, glandulis partim minutis luteolis, et sparsim breviter-

que (0,5 mm) pilosae. Pedunculi graciles, superne densissime floccosi, sat dense breviterque glandulosi fere epilos, 3—5 bracteis pallide viridibus in dorso obscuris obsiti. Flores lutei, stylis paulo obscurioribus. Achaenia brunneo-atra.

Foliatio ut in ssp. *Tommasinii* typ., inflorescentia *H. stuppeosi*.

Hab. Hercegovina: Polje pr. Trebistova inter Posušje et Podklečani, 900 m (Handel-Mazzetti); Montenegro: Njeguš 1000 m (Gelmi, Sagorski). — Albania: Greča versus Selce (Baldacci, It. Alban. VII no. 233!), Trijepsi (idem no. 186!).

Var. *β. pilosiceps* Rohl. et Zahn, in Fedde, Repert. VI (1909) p. 236; foliis caulinis ad 12 plerisque parvis, pedunculis dense minuteque glandulosis apice tantum pilis brevibus solitariis munitis, capitulis subcanoviridibus sat parvis subdense glandulosis subfloccosis disperse pilosis. — Montenegro: Ad coenobium Piva (Rohlena!).

Tab. 302. *H. Tommasinii* Rchb. f. ssp. *adenothyrsus* Sag. et Zahn (pr. Njeguš, leg. Sagorski). 1. Squama. 2. Pedunculus sub involucrio.

Subspecies *setosissimum* N. P. II 83. — Caulis ad 6 dm altus gracilis, aphyllopodus, apice ramosus. Folia caulina ad 20 oblongo-lanceolata v. lanceolata undulata breviter acuta apice saepe plicata basin versus longe sensim attenuata, aut inferiora conferta magna, superiora abrupte decrescentia parva lanceolata v. linearia longius acuminata, aut omnia sensim decrescentia, subintegerrima v. remote denticulata, glauca. Inflorescentia laxa paniculata, aeladio ad 8 cm longo, ramis 3—8 valde remotis, inferioribus longis divaricatis foliolaceis, ordinibus axium 3 (—4), capitula pauca v. numerosa. Involucrium denique globosum, squamis latiusculis acutis viridibus dorso obscurioribus. Bracteolae 2—5 parvae margine erinatae. Pili in involucrio modice numerosi diluti (1 mm), in caulomatibus superne dispersi, deorsum numerosiores v. densi tenuiter setosi (6—8 mm), in foliis supra nulli, margine nervoque dorsali numerosi ad 10 (—12) mm longi, subtus dispersi. Glandulae involucri subnumerosae dilutae subparvae, in pedunculis mediocres v. subnullae. Flocci in involucrio basin versus modice numerosi, caulomata superne canofloccosa, deorsum cito diminuti, sed profunde descendentes, in foliis nulli. Flores lutei, stylis subobscuris. Achaenia dilute brunnea.

Bosnia: Sarajevo (Blau no. 2377!), m. Trebevic (id. no. 1622! et 1664!), Starigrad (id. no. 677!), in v. Jarčedol pr. Sarajevo (Knapp!), in faucibus Miljačka et Mošćanica pr. Sarajevo (Maly!). — Hercegovina: Prenj planina (Prodán), Podporim 560 m (Maly). — Serbia: Mokragora (Pančić).

Tab. 303. *H. Tommasinii* Rchb. f. ssp. *setosissimum* N. P. (pr. Sarajevo leg. K. Maly). 1. Squama. 2. Pedunculus sub involucrio.

Sectio XX. *Hololeia* Fr., Epicr. 138 („*Hololeion*“); Zahn, in Koch Syn. (1901) 1929; *Cernua* Uechtr.; Freyn in Velen., Fl. Bulg.; *Oliganthae* A. Kerner, Fl. Austr.-Hung. no. 202! — Folia angusta, caulina pauca v. numerosa, basi attenuata v. subaequilata sessilia saepe subamplexicaulia, glauca, saepe glaberrima, sensim decrescentia. Capitula ± numerosa, squamis adpressis obtusis, ab extimis brevibus abrupte in interiores longas transeuntibus, subbiserialibus. Ligulae apice glabrae, stylus obscurus. Achaenia ± brunnea. Alveoli dentati. Phyllopodium v. aphyllopodium. Inflorescentia laxa paniculata saepe valde squarrosa.

178. Hieracium sparsiflorum (Friv.) Fr. Epicr. (1862) p. 139; *H. sparsum* Friv., in Flora (1836) p. 426 pp.: *H. Reuterianum* Boiss., Diagn. I 4 p. 31 et in Fl. Orient. III (1875) p. 872.

Subspecies numerosas in Caucaso, Asia minore, Peninsula Balcania et in Transsilvania habet, unam etiam in Silesia (*H. silesiacum* Krause), alteram in Tirolia et Carinthia: *H. Grisebachii* A. Kern.

Subspecies **Grisebachii** A. Kern. in litt. ad Griseb. (1861) et in Fl. Austr. — Hung. nr. 202 (1881)!; Zahn, in Koch Syn. (1901) p. 1930. — Caulis ad 3 (cult. ad 5) dm altus, phyllopodus v. hypophyllopodus erectus strictus glaberrimus, inferne foliatus superne bracteatus. Folia glauca subcito (cult. sensim) decrescentia elongato-lanceolata, basi vix attenuata sessilia semiamplexicaulia, inferiora conferta remote denticulata sparsim pilosa v. glabrescentia, interdum margine nervoque dorsali basin versus subdensius breviterque pilosa, superiora \pm remota glaberrima integerrima in bracteas transeuntia. Inflorescentia racemosa v. paniculata (in planta culta valde squarrosa) oligocephala; rami 3—4 breves 1—2 cephalii (in pl. cult. elongati oligocephali). Involucrum gracile cylindricum glauco-olivaceum, squamis parum numerosis subbiseriatis, e basi latiuscula acuminatis obtusis apice subbarbulatis, epilosis, interioribus sordide viridibus, extimis brevibus subatris. Bracteolae complures, in squamas transeuntes. Flores lutei, stylus obscurus, achaenia pallide rufo-brunnea.

Tirolia: in valle Oetzthal: inter Pillberg et Gurgl 18—2000 m (Tappeiner! 1844 sub nom. *H. Hausmanni* in sched.: A. Kerner in Fl. Austr.-Hung. exs. 202!). Carinthia: Gartenalpe pr. Reichenau (Pacher sub. nom. *erocatum* et *lupuleuroides*?).

Tab. 304, fig. B. *sparsiflorum* (Triv.) Fr. ssp. *Grisebachii* A. Kern. (in v. Oetzthal loc. class. legi). 3. Squama.

Subspecies **silesiacum** Krause, Jahresber. schles. Ges. (1850) p. 101; Fr., Epicr. (1862) p. 96; Fick, Fl. Schles. p. 277; *H. vulgatum* \times *prenanthoides*? Neilr., Krit. Zus. Hierac. (1871) p. 476; *H. prenanthoides-rigidum* vel *-vulgatum* Krause l. c. — Phyllopodum. Caulis \pm gracilis erectus, (2—) 3—4 dm altus, saepe subascendens, substriatus, saepe subflexuosus, compressibilis, inferne v. ubique disperse v. mediocriter pilosus, effloccosus, eglandulosus. Folia radicalia 2—5, florendi tempore interdum \pm emarcida, exteriora elliptica v. oblongo-ovata, in petiolum alatum \pm brevem attenuata, obtusa mucronata; caulina (3—) 4—8 (—10) sensim decrescentia subremota lanceolata, inferiora basi longe attenuata subpetiolata, basi ipsa late vaginantia, sequentia longa lanceolata v. oblongo-lanceolata, basi brevius longius attenuata petioliformia, reliqua basi longe v. (summa) breviter attenuata sessilia subamplexicaulia, omnia acuminata acuta. Folia omnia lutescenti- et canescenti-viridia glaucescentia, subtus subconcoloria, margine remote arguteque denticulata, rarius leviter sinuato-dentata, summa subintegerrima margine subrevoluto, supra glabra, subtus disperse, margine nervoque dorsali modice pilosa. Inflorescentia paniculata v. racemoso-paniculata, (2—) 4—8 (—12)-cephala, acladio 3—12 mm longo, ramis 2—6 rubremotis, oblique v. subarcuato-ascendentibus saepe brevibus, simpliciter ramulosis. Involucrum cylindrico-ovatum basi rotundatum, (11—) 12—13 mm longum, initio saepe nutans, squamis latiusculis obtusis irregulariter imbricatis atroviridibus albido-viridi-marginatis, interioribus albido-viridibus, pilis dispersis subatris glandulisque sparsis parvis obsitis. Pedunculi consimiles, pariter ac involucrum subeffloccosi. Flores saturate v. aureo-lutei, ligulis glabris. Stylus obscurus, achaenia dilute brunnea.

Moravia: In montibus „Gesenke“: Grosser Kessel, Hungerlehne, Leiterberg, Altvater, Ameisenhügel.

Exsiccata: Hieraciotheca Europaea No. 398.

Tab. 305, fig. A 1, 2. *H. sparsiflorum* (Friv.) Fries ssp. *silesiacum* Krause (Grosser Kessel, leg. A. Oborny). 1. Squama. 2. Pedunculus sub involuero.

Subspecies **tubulatum** Zahn, in Mag. bot. lap. (1906) p. 81. — Caulis ad 45 cm altus gracilis v. subcrassiusculus subtiliter striatus basi subascendens, strictus, fere modice v. basin versus subdensius pilosus, etiam glandulis dilutis valde inconspicuis solitariis obsitus, phyllopodus. Folia rosularica c. 5 saepissime breviter petiolata, exteriora elliptica obtusa v. oblonga obtusiuscula, interiora late lanceolata v. lanceolata acuta ad 16 cm longa et 3 cm lata, omnia tenuiter papyracea, basin versus cito sensimve attenuata (interiora in petiolum alatum angustata) repando-denticulata v. interdum 1—2 dentibus maioribus praedita, olivaceo-viridia glaucescentia, supra fere epilosa, interdum pilis nonnullis brevibus adspersa, subtus parce molliterque pilosa, in margine nervoque dorsali mediocriter pilosa et praecipue iuniora distincte microglandulosa, petiolus basin versus (saepe violaceus) subvillosulus, pilis 1—3 mm longis; rosulae iuniores basin versus pilis ad 6 mm l. sericeo-villosae; caulina 3—4 remota, inferiora 1—2 radicalibus similia basin versus longe attenuata sessilia, reliqua anguste lanceolata v. linearia. Inflorescentia laxa squaroso-paniculata indeterminata, acladio ad 25 mm longo, ramis primariis 4—6 valde remotis, inferioribus elongatis apicem versus simpliciter (rarius dupliciter) ramulosis 2—6-cephalis. Capitula 10—20. Involucrum 11—12 mm longum crasse cylindrico-ovatum basi rotundatum, squamis sublatiusculis longe acuminatis apice obtusiusculis v. internis acutis, apice subbarbulatis dorso obscuris v. nigro-viridibus, internis margine pallide viridibus, omnibus pilis subobscuris basi atris 2 mm longis subpilosis et glandulis mediocriter numerosis conspicuis varie longis, praecipue basin versus etiam floccis subdispersis obsitis. Pedunculi tenues subflexuosi modice pilosi subglandulosi subfloccosi, pilis obscuris basi atris 1,5—3 mm longis. Bractaeae 3—5, superiores sub involuero confertae squamiformes, sed angustiores quam squamae, obscurae subpilosae subglandulosae. Flores dilute lutei exsiccati pallide lutei, omnes anguste tubulosi apice breviter dentati subciliati; stylus obscurus ex tubo haud exsertus. Achaenia dilute brunnea.

Hungaria: Vurfu Pelaga in m. Retyezát. 20—2300 m (A. de Degen!); Bosnia: in rupium fissuris m. Veternik Ljubična-planinae (G. de Beck!).

Tab. 306. *H. sparsiflorum* (Friv.) Fries ssp. *tubulatum* Zahn (e m. Vurfu Pelaga, leg. A. de Degen). 1. Flos. 2. Squama. 3. Pedunculus sub involuero. .

Subspecies **Kotschyanum** Heuff. in Flora (1853) p. 618; an Freyn in Velen., Fl. Bulg. 351? — Caulis 2 ad 4 dm altus gracilis pilosus v. superne glabrescens, phyllopodus. Folia radicalia 2—5 oblongo-lanceolata v. lanceolata utrimque attenuata breviter alato-petiolata, externa subobtusa, sed florendi tempore plerumque emarcida, omnia lutescenti- et glaucescenti-viridia supra ± glabra, subtus subdense pilosa, integerrima v. obsolete denticulata, pleraque acuta; caulina ad 8 anguste lanceolata v. summa linearia, subtus pilosa. Inflorescentia racemoso-paniculata, acladio ad 10 mm longo, ramis 4—8 brevibus (inferioribus saepe abortis) 1—3-cephalis (v. capitulum terminale tantum evolutum, inferiora 2 aborta). Pedunculi superne floccosi sparsim pilosi subglandulosi. Involucrum 12—13 mm longum globoso-ovatum effloccosum subpilosum subglandulosum; squamis latiusculis lanceolatis obtusiusculis v. internis acutis. Ligulae luteae, stylus obscurus, achaenia brunnea.

Transsilvania: Versus alpem Retyezát, comit. Hunyad Hungariae (Heuffel!); in valle „Kimpu nyelului“ ad fontem fluminis „Oláh Zsil“ sub alpibus Retyezát 1250 m (Jávorka).

Tab. 307, fig. A, 1, 2. *H. sparsiflorum* (Friv.) Fr. ssp. *Kotschyianum* Heuff. (e loco classico, leg. A. de Degen). 1. Squama. 2. Pedunculus sub involucri.

179. Hieracium stirovacense Deg. et Zahn, Mag. bot. lap. (1906) p. 91 = **sparsiflorum—gymnocephalum?**; *sparsiflorum—Orieni* Zahn l. c. — Habitu *H. gymnocephali* Griseb., sed multo minus pilosum. Rhizoma crassiusculum fibrillosum saepe pluricaule. Caulis 25—30 cm altus gracilis v. crassiusculus subflexuosus, subangulato-striatus, superne parcepilosus, basin versus densius pilosus, effleccosus, eglandulosus, demum brunneo- (basin versus violaceo-) coloratus, hypophyllopodus. Folia radicalia florendi tempore emarcida, sed in rosulis non cauligeris lanceolata sat longe petiolata, utrimque (basin versus longius) attenuata, acutiuscula mucronata. Folia caulina c. 6, inferiora 2—3 magis elongata (110:17 mm) lanceolata, basin versus longe attenuata, sessilia v. breviter alato-petiolata, apicem versus minus longe subangustata acutiuscula, media breviora, fere aequilata, basi rotundata sessilia, supra basin saepe paulo angustiora, inconspicue panduriformia, breviter acuta; summa e basi ovata sensim acuminata breviter acuta v. acuta; omnia dilute viridia, superne parum glaucescentia, margine remote denticulata, saepissime subundulata, apice mucronata, utrimque pilosa, in margine nervoque dorsali subvillosa v. fere villosa, pilis subsericeis flexuosis distincte dentatis more *H. gymnocephali* contexta, summa saepe in parte superiore glabra. Inflorescentia furcata 1—2-cephala, acladio 2—9 cm longo, ramis primariis 1. Involucrum 11—13 mm longum late ovatum demum depressum basi truncatum; squamae imbricatae triangulariter lanceolatae basi ad 2 mm latae, e basi lata sensim acuminatae acutae olivaceo-virides, dorso obscuriores, pilis sparsis dilutis brevibus flexuosis glandulisque solitariis v. dispersis brevibus obsitae, effloccosae. Pedunculi superne subsulcati et sparsim flexuoso-pilosi effloccosi virides. Bractee 3—6, inferiores 1—3 remotae, in acladio interdum subfoliolaceae, reliquae sub involucri confertae squamiformes. Flores lutei, ligulae apice glabrae, stylus luteus, achenia demum dilute brunnea ad 4,8 mm longa.

Croatia: in rupium fissuris m. Stirovač (Badauj) prope Medak rarissimum (A. de Degen!). — Julio.

Tab. 307, fig. B. *H. stirovacense* Deg. et Zahn (e loco classico, leg. A. de Degen).

180. Hieracium gymnodermum Benz et Zahn = **sparsiflorum—atratum**. — Phyllopodum glaucescens. Caulis gracilis ad 45 cm altus striatus, basi tantum subpilosus. Folia radicalia 2—3 longe petiolata oblongo-lanceolata magna breviter acuta v. acutiuscula, in petiolum longe attenuata, tenuiter papyracea, valde glabrescentia v. glabra, in margine petioloque modice breviterque ciliata et disperse glandulosa, praecipue infra medium \pm grosse et irregulariter sinuato- et subserrato-dentata; caulina 4—7 remota, inum radicalibus simile, reliqua basi attenuata sessilia oblongo-lanceolata v. basi truncata v. ovata sessilia parum amplexicaulia magis acuminata acuta basi grosse dentata v. summa \pm integerrima. Inflorescentia laxa paniculata, acladio ad 3 cm longo, ramis 3—5 remotis oblique erectis simpliciter ramulosis 1—3-cephalis. Capitula 6—12. Involucrum globoso-ovatum atro-viride subdense glandulosum subeffloccosum, squamis latiusculis lanceolatis obtusiusculis v. acutis, internis viridi-

marginatis. Pedunculi atrovirides subdense floccosi glandulosique. Flores lutei, ligulae ciliatae, stylus obscurus, achaenia atrobrunnea. — Verosimiliter inter *H. atratum* Fr. et *H. sparsiflori* ssp. *Grisebachii* hybridum. — Initio Aug.

Carinthia: Gartenalpe pr. Reichenau, in consortio *H. atrati* et *H. Grisebachii* (leg. Pacher!).

Tab. 308. *H. gymnodermum* Benz et Zahn (e loco classico). 1. Apex ligularum. 2. Squama. 3. Foliorum margo.

181. Hieracium Naegelianum Pančič, Elench. pl. in Crna Gora lect. (1875) p. 57; N. P. II p. 6; Baldacci, Riv. coll. bot. Alb. (1895) p. 54; Halácsy, Consp. Fl.
